If you are considering an older rig, make sure it has "general coverage receive" and AM (at least 500 kHz to 30 MHz), otherwise you may be limited to SSB/CW or just the ham bands. For receive antennas, what you are now using will also work fine. A random length of long wire usually works just as good with a ham transceiver as it does with a shortwave radio, sometimes even better.

Hi to all:

I got my R-75 about 3 weeks ago, and sent in for the DSP in late March.
About how long is it taking ICOM to send out the DSP?

Thanks,

Art

Your opinion differs from mine. I'd much rather have an AR7030+ or an R8B over a ham transceiver for listening any day. In fact, most of Icom's current desktop radios (with the exception of the 775DSP and the R8500) have similar receiver characteristics --basically the same as the R75. However, the higher end transceivers do offer more bells and whistles. But unfortunately, they are not usually much useful for shortwave listening -- lots of CW stuff though. In fact, Icom rigs are NOT generally known for their receive sound quality. (Perhaps you are talking about Kenwood and Yaesu?.) In any case, my local radio club will be acquiring a 756PROII soon and I will spend some time with it. But from what I've already observed and heard from others, I doubt my opinion will change much (but you never know).

Jerry

P.S. I have had my R-75 for a year and a half and like it very much just
the way it came out of the box.

I sent my coupon on March 13 (the day I bought the rig) and haven☐t received it yet ☐ I believe Icom stated 4-6 weeks delivery time. Trust me that it is worth the wait . . . I have the Icom 718 with the same DSP installed and it does a great job in that rig. BTW, these two radios LOOK fantastic sitting next to each other ☐ almost makes me want to have the IC-910H to complete the set! ☐Transceive☐ function is neat as well . . you can use the R75 for the ☐ears☐ and transmit with the 718.

Alan,

KØADL

Out of interest, how would you think that a piece of wire will "work better" depending on what it is connected to? What will the wire do better?

If any of you have a chance to personally get into an amateur radio store such as Ham Radio Outlet or AES, by all means get into the store and try out some of the "big gun" transceivers! Let the store people know that you are not a ham, but want to check out the receive section of the radio, that you are aware that it is not legal to transmit without a license and you have no intention of doing so.

Many of the best receivers are found on ham radios. For 90% of the amateurs out there, the cheapest, most basic transmit section will cover almost their needs. What sets the most expensive rigs apart from the "entry level" ones are the receivers and its receive features. Most hams spend more time listening (*hopefully*) than talking. I personally would rather have a great receiver and an "adequate" transmitter than studio quality transmit sound and a clock radio quality receiver.

Some of the older transceivers make excellent receivers. Most need the help of an external speaker even for amateur and utility listening (those top firing speakers stink). I've been playing with a Kenwood TS-940 and the operation of the rig and the receive quality is incredible. On Friday, I participated in a net on 20 meters and there was another conversation that started up which was centered 1.5 kHz above our frequency at about S7-S9. With the 940's TBPF, I cut the "monkey chatter" out completely and only lost a little of the top end sound of the other stations. On other radios, I've had a hard time with signals twice as far away. The sortwave broadcast receive of the radio is also top notch and by using ECCS, I had no problem with its lack of sync detect.

If you are considering an older rig, make sure it has "general coverage receive" and AM (at least 500 kHz to 30 MHz), otherwise you may be limited to SSB/CW or just the ham bands. For receive

antennas, what you are now using will also work fine. A random length of long wire usually works just as good with a ham transceiver as it does with a shortwave radio, sometimes even better.

I guess I misstated. Maybe this will clear it up.

"The same long wire you may be using on your shortwave radio may
work even better on a good ham transceiver than on your shortave
radio." The wire will "work better" on a "better" receiver.

wire + ham radio > wire + shortwave radio (maybe)

This means you don't have to go out and get an "amateur radio
transmitting antenna" just because you went out and got a ham
transceiver if receiveing is all you intend to do.

The power plug connector on the R75 side is 6.3mm OD / 3.0mm ID. Radio Shack p/n is 274-1572A. I just wrote an email a couple weeks ago about this. Remember the R75 has a 3 amp fuse inside so might want to put a smaller fuse on the outside. I'm using a dual 2 amp fused lead from another Icom product and it works OK.

Hi Ed,

As moderator of this group I usually receive notifications of such important events.
No such notification yet about fees for subscription at yahoo groups.
I also think that we are bombarded enough with ads to put a fee on top of it.
If they introduce such fees - I think this will be the end of Yahoo.

Best regards,

Rado

Bruce,

Don't remember where or how exactly, but a few weeks ago I read something about it in a newsgroup.

Yesterday I also got a question from a member of the Yahoogroup I moderate myself, and she said that she had received an email from Yahoo asking her to pay $ 19,99 for her Yahoo email address. So she asked if this could also mean that she had to pay for the messages to be send or received via the free groups.

I agree with your opinion. I would also leave all Yahoogroups if that happens.

Thnx!

g'day to all on the r75 forum

only wish i had time to read all the posts
the volume and depth of material is excellent

fwiw

i think you guys are missing the point in looking towards a new and better receiver from icom with if dsp

i am guessing the reality is that you already have the best receiver you are likely to ever get you hands on, (provided you are prepared to open the lid and tinker professionally with mods) and the real question should be : should i buy an extra r75 or two and put aside for future use if the current set ever fails and becomes unrepairable? ditto inrad and icom xtal filters. the r75 will have a strong resale value for decades to come - read difficult to find (tried to acquire a good second hand icom 765 lately?)

i see the present progression towards software defined radios as likely to result in a significant reduction in dynamic range and thus selectivity under strong signal conditions, given the possibilities of producing such sets at lower cost.

the present situation seems to be akin to the late 60s when the first generation of solid state receivers came on the market with generally dreadful performance in terms of dynamic range - even my beloved drake spr4 is a victim and i regard it as second generation.

i have had a 2.8 filter for 3rd IF on order with icom australia for more than 6 months, still no supply, there is such a limited market for expensive add-on accessories to a relatively low-cost limited market product that i suspect the volume of sales is such that it is more trouble than it is worth for icom to handle this stuff and as DSP takes over xtals filters will disappear entirely as a consumer product - along with their great performance. if we are lucky we will be left with at most one second rate xtal filter in the 2nd if and the rest will be software.

good close in dynamic range departed the scene in the 70s with the universal adoption of vhf upconversion and simple 2 pole monolithic xtal filters, now we can kiss goodbye to even moderate space dynamic range as the likely single 2nd IF filter becomes a ceramic unit.

my dreaming is confined to an outboard 2nd and 3rd IF unit for the r75 with about 10 switchable matched pairs of xtal filters for 250Hz, 500Hz, 1kHz, 1.8kHz, 2.1kHz, 2.4kHz, 2.8kHz, 3.3kHz, 4kHz &

6kHz (isn't it a shame the drake r7a was so drifty and unreliable - an otherwise adequate base for a great receiver?). inrad should make the bare accessory and give it away just to create the market for its excellent xtals!

have a nice day

73s gd dx de sam dellit vk4zss

Well, your best bet is to "make" one. This isn't hard.

The cheapest (and least reliable) way of doing this is to go to Radio
Shack and getting a NE-2H neon lamp (the bare bulb without the resistor
in the lead) and putting it across the antenna connections.

Far better would be to go to an electronics/surplus house in your city
(practically anyone has one within 25 miles) and pick up a gas discharge
tube. These have a ceramic case and substantially heavier wires off
the ends, and are the working components of most lightning arrestors.
It looks vaguely like an aspirin tablet sandwiched between two metal
caps.

In either case, get a 0.01 uF, 1000 volt capacitor to put between your
radio and the arrestor. So a crude diagram would be:

```
cap.
----||---+---- to antenna
ICOM v
R-75 ^
---------+---- to ground
gas tube
```

...hope this is helpful. Please let me know if it isn't. Your wire
can go up as several thousand volts in potential when storm clouds
are overhead, even if there's no lightning.

Your R75 already have at least 90 dB ultimate rejection! Inrad filters in the 9MHz would be nice, better shape factors. Icom use better filters in the more expensive transceivers. I think the FL80 2,4 kHz should fit nicely in the R75.

Hello. My name is Rick and I just purchased my iCOM IC-R75 yesterday) Friday and I should receive it this upcoming week - I can't wait.

I have posted this message to let you know that should Yahoo choose to charge for these services, I have my own server and I would volunteer create a listserver for this group or I can create a php bulletin board (from the many programs out there) to continue this fine group's work.

Although I'm new to the group, I will gladly offer up my services to be involved. I'm not a "computer company" but I have a "hobby" of creating and maintaining sites and it makes for great tax write offs (yes I declare the income ;-). I do rent my own server space for my "company", so I have full programming access (I'm not a "propeller head" but I can get by), a listserver, or bulletin board (my preference as I like to go back and read message threads - I don't have messages sent to me on this group, I prefer reading them on the web)are easily set up.

The server would be at www.abstractsolutions.com - there is no commercial benefit, nor hidden agenda for me to offer the services.

If the moderator of this group would like to email me at rick@... ('cause I don't have these web messages emailed to me) I'll gladly discuss the possibilities.

This is a volunteer service I would be giving. Full moderator priveleges and authorities can be set up for the current moderator, and "associates" if he/she wishes. I'd just be in the background, you "guys" would be running it as you do here.

Just wanted to offer my help.

hi Rick!

you're going to love your R75! it is very nice of you to offer your services and bulletin board space. if yahoo gets anymore annoying (can they get 4 adds on a page?) we might have to take you up on it. you'll find that one of the greatest assets of the R75 is this group... the people on here make the shortwave experience better. you will also find many of us on the newsgroup: rec,radio,shortwave.

welcome aboard!

1508. Filters for BC AM?

Yahoo group: icomr75 (2000 — 2002)
Date: 2002-04-21 17:35:29 UTC
From: Alan Lloyd
Topic: 1483 Message: 1508

I recently bought an R75 and haven□t put any optional filters in it. Although I am a licensed amateur, I bought the R75 primarily for broadcast band DXing and to compliment my IC-718. The secondary interest is to be able to monitor PSK31 signals on other bands during a contest, etc. using two different computer sound cards.

My question: What would you recommend for filter combinations for BC band DXing? I know that there are other options outside those offered by Icom (InRad, Collins?), so I am open to whatever folks think would be the best combination regardless of manufacturer. So tell me your thoughts, and more importantly, defend your recommendation for filter combinations □ in other words, tell me WHY you recommend a particular combination over another for my stated interests. Why is what you are recommending a good thing for me?

Finally, I know some sources for Icom filters, and know about International Radio Co., but are there filters made by Collins for the R75? If so, who sells them? Any other options besides those three companies?

Thanks in advance!

KØADL

From: just_rtfm
Topic: 1483 Message: 1510

hi KØADL:

IMO the stock filters are good so fool with them first. for BCB dxing use the dual 2.4 kHz filters and ECSS. if you need narrowing turn the PBTs in opposite directions... need more? consider a 1.8 kHz or 2.1 kHz ICOM or INRAD filter.

as far as digital (PSK-31) signals the stock dual 2.4 kHz filters work great when pumped into your computer's sound card input for decoding. the wider the filters the more 'action' you can see on the software's bandscope. the programs have no problem digging out the signal. i like the freeware program called digipan: http://www.digipan.net/

filter sources: INRAD & ICOM... since 455 kHz is a standard IF you can also purchase them from other manufacturers and solder them in yourself: kiwa, etc.

phil :)

Even if Yahoo is still up it is a nice idea to have bulletin boards instead of/in addition to mailing list.
Bulletin boards are more convenient for reading/accessing from the web (any computer). When trying to read yahoo's archives the adds are really anoying.

> Although I'm new to the group, I will gladly offer up my services to

If we (the group) decide to move to bulletin boards can you also handle the "Files" section. It contains about 20MB of files/info/etc.? There should be a download section where people could download these files. The uploading could be done by e-mailing the file to the moderator (you). You then check the file and post it.
Another thing - the archives of this group (the knowledge base) have to be taken care of. I can do this job. I will make a PDF file containing all the useful info/disscusions categorized.

> This is a volunteer service I would be giving. Full moderator
> priveleges and authorities can be set up for the current moderator,
> and "associates" if he/she wishes. I'd just be in the background,
> you "guys" would be running it as you do here.

Moderating this gorup until now has been very easy - nothing to moderate. There have been only 1 or 2 cases of messages which I have deleted. I am not sure if moderating a buletin board will be as simple (not time consuming) job? I do not have much free time ... :-(. I will be glad if you can take the moderator job - it is your server space, boards job, idea etc.

About the decision - it will be the group that will decide. I will create a poll.
In any case - if you keep the site open and the people find it more convenient than the yahoo groups the discussions will shift themselves to the bulletin boards. Then this group could be closed (or left as a memorial :-) painlessly.

Another very important thing - can you guarantee that your site will remain non commercial and free to access in the future? Sure you can put one or two adds to cover the traffic costs but do not try to make a proffit!
My experience is that comercializing a hobby never works.

OK ... lets see what the group thinks ...
Meanwhile - you can post from time to time an "add" :-) that your boards are open and try to "light the fire" there ... It never starts by itself ... I remember the first days/weeks of this group ... maybe 50% of the messages are from me. :-)

Best regards,

Rado

1512. New poll for icomr75

Yahoo group: icomr75 (2000 — 2002)
Date: 2002-04-22 01:58:56 UTC
From: icomr75@yahoogroups.com

Enter your vote today! A new poll has been created for the
icomr75 group:

What is your opinion on moving the
disscussions to bulletin boards? (see
http://www.abstractsolutions.com/ic-r75)

o Let's do it!
o It is OK, but also keep the mailing list.
o No, I like the mailing list better.

To vote, please visit the following web page:

http://groups.yahoo.com/group/icomr75/polls

Note: Please do not reply to this message. Poll votes are
not collected via email. To vote, you must go to the Yahoo! Groups
web site listed above.

Thanks!

Yes, I can create a download page, that's not a problem. I'd just have to download the existing files from this site, then upload them to my server and create the download page with the appropriate links. Users of the site could email me the new files, or I could create an upload program to do it. I'd have to check to see which was best for the users.

> Another thing - the archives of this group (the knowledge base)

An area on the new site could also have the archives if you are able to put them in a useable format, ie: pdf would work fine. Again, then you could send them to me or post them here and I could upload them to the new site.

I have no problem with looking after the moderating. I read all the messages now anyways. I have no doubt there has been little problem. A community like this is not ususally a problem as we're not discussing a life threatening topic ;-)

Yes, I can assure everyone that the new site wouldn't be a profit making venture. I have the server space whether it gets used or not. If the volume of traffic became very large and the server space was consumed in great quantities. If this occurred, I would think that at most I would entertain one standard banner 468 X 60 at the bottom of pages, so there could be "corporate" sponsor to underwrite expenses if they became problematic. But I don't see a problem at this time or in the forseeable future that there should be any need for any type of advertising. As you mention - this is a hobby site, for me as well.

Well, if the group were mostly interested in moving to a different format, then the move would happen as people chose to use the new format, and it would be a fairly quick change over if accepted.

I look forward to everyone's thoughts.

Check out www.abstractsolutions.com/ic-r75 to see how the new site looks. There is a link from the main page to the forums.

Thanks,

Rick

Umm.. When I figure out what all this means would somebody kindly let me know? :-)
Acyually, I enjoy the convenience of mailing a list, but can also see the benefits, especially in the area of access of a BB. I guess my question would be; Does it have to be one or the other? Is there a way to automatically cross post or forward from maillist to BB or versa vice?

The concern arose that Yahoo might be charging for in the future (at the end of April) these services. That's what prompted the offer of a bulletin board based site. Usually because of the way the software works, it does become a choice of either or, only because it is impossible (at least with my knowledge) to have a mailing list be posted to a message forum format simultaneously.

A mailing list can be set up on the www.abstractsolutions.com/ic-r75 site as well, if some wanted that.

Excuse my ignorance, but is there a different charge in regard to the call cost when logging onto a BBS. I am in OZ

Lew,

If you pay for your internet access by the minute or by the amount of
data transferred, the answer is yes.

Generally, web-based BBS's have higher overhead because they are drawing
all the graphics, and the expand thread options, and so on.

Now, if you are using web-based email, that comes out a wash, but if you
keep email on your home system (like Eudora will) then the bandwidth
used is lower and you can keep "important" messages for reference.

Personally, given the choices, I'd prefer a mailing list. But I'd like
to throw out the idea of a usenet group as well, which doesn't burden
any one individual with the load of maintaining the list. The downsides
of a usenet group are obvious to those who use usenet... :-)

Actually I use my real name and email on usenet and had very few
spams until I got a Yahoo account. Now I get 30 or more a day as
opposed to 2 a week.

1526. Re: Antenna questions

Yahoo group: icomr75 (2000 — 2002)
Date: 2002-04-27 13:12:47 UTC
From: harveymillerca
Topic: 1443 Message: 1526

Hi Lou:

Sorry for the late response to your post, but before suggesting this random wire setup, I wanted to check it out for myself; Sounds like you're thinking about a 'John Doty low noise antenna';
http://www.anarc.org/naswa/badx/antennas/low-noise_antenna.html
There's a diagram of this setup on the Wellbrook Antenna site as well;
http://www.wellbrook.uk.com/longwire.html
In addition to the random wire and buried coax feedline it requires two ground rods (I got mine from Home Depot) and a balun (I purchased the ICE 180A from the eham website). It's main virtue is a reduction in local electrical interference (which I thought would be great for my urban setting with above ground electrical services).
I set this up to be approx. 65 feet long and 10 to 16 feet above ground using one 50 foot run of buried coax and 50 feet of coax above ground.
My first impression of it was that it was pulling in less signal than my previous random wire (the Radio Shack kit; 75 foot wire about 4 to 6 foot above the ground with 50 foot single insulated feedline to Ant 2), a big disappointment! After using it for about a week I'm now thinking that it feeds between S3 to S5 less noise with the signal. Looking through my logging database I would say an S3 signal this antenna compares in audio quality to a S7 to S9 signal on the old antenna. For instance I'm now happy program listening (some static, but clearly and easily listenable) to signals coming in at S3, and can sometimes catch most of the content of programs at S1 without much listening effort on my part; ie NHK- Tokyo 15,590 kHz 10:00 UTC, signal strength S1 SIO 333, DW-Cologne 11:00 UTC 17,860 kHz signal strength S2 SIO 423 (daytime listening, SIO = Signal, Interference, overall quality). Unfortunately I cannibalized my previous random wire, so I can't make direct A-B comparisons, but I do feel overall it's made weaker signals more audible.

Regards
from Ottawa
Harvey

1527. limitations of the R75's signal meter (S meter)

Yahoo group: icomr75 (2000 — 2002)
Date: 2002-04-27 17:26:40 UTC
From: sp500dogtrainer
Topic: 1527 Message: 1527

After studying the numbers that you get on the rs232
verses the signal meter reading on the R75 display i have
decided that the thing has a large gap from numbers 0 thru 31

should i just consider the missing ones negitive db
and number the s meter on my software starting at
-2 -1.5 -1 0 .5, etc

1528. S-AM Mod Done!

Yahoo group: icomr75 (2000 — 2002)
Date: 2002-04-27 20:23:19 UTC
From: KØADL
Topic: 1528 Message: 1528

I performed the "Rado" S-AM mod v 1.1 (see files area) this morning. It took about two hours to perform. The modification works and makes S-AM and AGC work much better. Broadcast short-wave IS easier to listen to.

Now -- here's the words of warning: If you have no experience at soldering, don't even think about doing this mod. I have moderate experience soldering, having successfully put together a few kits, including an Oak Hills Research transceiver, and this was NOT easy soldering. The biggest problem is that the work area is very small and difficult to see. Get LOTS of light, a magnifying glass, some good quality rosin core solder and, most importantly, a VERY fine tipped 15 watt soldering iron -- they cost about $6 at Radio Shack, and WELL worth it!

Despite my best efforts, I managed to completely snap off pin 23 from the IC. I did this because I chose to solder the wire to the pin FIRST (after successfully liberating it from the circuit board -- see the mod file). Because the wire was already soldered to pin 23, the strain of moving it around while I soldered the other end, caused the pin to snap off! I freaked-out for 10 minutes! So . . . solder everything else FIRST, tape it all together (or mount it on a perfboard (as I did), THEN, once everything is in place, solder your wires to the IC. Soldering to the IC should be the LAST thing you do before buttoning up the radio.

How did I salvage my new and expensive radio? I ended up drilling a tiny hole down through the edge of the IC above pin 23 with a Dremel tool, then I stuck the wire in there, flooded the hole with solder and hoped for the best (what did I have to lose at that point?). Fortunately, everything worked as described -- S-AM works and I get the 2 second whine when I turn it on -- which tells me that the connection to pin 23 is good.

Long story short, the mentally unstable as well as those who are shaky (no pun intended) with regard to soldering should pay someone else to do this mod. The good thing is that once it is done, you will have an even better receiver. If you go ahead and do it yourself, please heed my warnings about the order of soldering.

Good luck,
KØADL

1529. RE: S-AM Mod Done!

Yahoo group: icomr75 (2000 — 2002)
Date: 2002-04-28 15:26:07 UTC
From: John M Gedde
Topic: 1528 Message: 1529

Glad to hear you got it working after the trouble you had.

I mention the following for the benefit of those who may attemp the mod i the future:
When I did my mod, I lifted the pin, soldered the wire to it, then secured the pin and wire to the board at the chip body with a small blob of epoxy applied with a toothpick. I then waited for it to dry before I went further.

Another option is to use wire wrap wire to make the connections since it is thin and flexible. Hence it doesn't transmit much strain the the pin when moving the other end around. I still recommend the epoxy too....

With mod 1.1 you lose the automatic S-AM functionality and the blinking S-Am indication. This functionality is restored if you perform Rado's v2.0 mod, or my v2.1 mod.

Regards,
John Gedde

That's exactly the one I was thinking about, I even was looking at the ICE180A on eham.net! I also bought my ground rod at Home Depot -- I went with the 10ft. copper-clad one.

>My first impression of it was that it was pulling in less signal than
>my previous random wire (the Radio Shack kit; 75 foot wire about 4 to
>6 foot above the ground with 50 foot single insulated feedline to Ant
>2), a big disappointment! After using it for about a week I'm now
>thinking that it feeds between S3 to S5 less noise with the signal.

We must be psychically linked or something, because I set up the RS kit this weekend. Before that I was using a random wire in the attic.

What was the disappointment? The Doty low-noise setup or the RS kit? I live in the country, but I set up the RS wire attached to the house on one end, and it is about 75ft. from my neighbor's electric fence. I wanted to move it away from the house and the fence because then I should have very little electrical noise. I have a bunch now, including when my computer writes to the disk I can hear clicks on certain frequencies. The antenna pulls in pretty good, but I eventually want a 100 or 200 foot inverted L moved away from the noise.

It also wasn't clear if it was attenuating your signals. Are the normal signals weaker? If so I'm wondering if maybe the ICE 180A isn't transforming the signal quite right. I was thinking one benefit of the Doty homebrew transformer is that one could tweak it for a better match by changing the windings.

Thanks for the great info! Looks like we are both playing with the exact same setups!

I suggest you use the 340018, instead of a hose clamp, to attach the grounding clamp to the rod.
http://www.rohnnet.com/CommPro/Hardware/Grounding.htm
You can turn half the clamp around to fit tightly on a 5/8" rod.

These are available at any store that sells such things.

From: harveymillerca
Topic: 1443 Message: 1532

Hi Lou:

>What was the disappointment? The Doty low-noise setup or the RS kit?

At first I was disappointed in the Doty setup because it was giving lower signal strength meter readings, but I now think that was mainly due to a lower noise component (signal strength being equal to signal plus background noise) hence my lower meter reads were due to less background noise. Sound quality on weaker stations is notably better with the low-noise setup. Powerhouse stations show less improvement, because they sounded fine before.

>Are the normal signals weaker?

With the RS antenna the highest signal strength I've logged was 40 dB (Deutsche Welle 9,700 kHz and 9,765 kHz on 2002/3/18), In the week or two that I've had the Doty antenna about the best I've gotten was 20dB (maybe propagation conditions are poorer? I don't know) . Does it matter to me? -Not really, because the signal quality on the powerhouse stations hasn't really changed. I think that I'm catching at least the same number of stations now, if not more, and overall signal quality has improved with the low noise setup.

>I wanted to move it away from the house and the fence because
>then I should have very little electrical noise. I have a bunch
>now, including when my computer writes to the disk I can hear
>clicks on certain frequencies

With the Doty antenna I do get some clicks coming from a fan motor turning on or off, causing the household current to spike, but nothing as bad as the Radio shack kit. The nice thing about the Doty setup is it isolates the antenna from both household noise and feedline induced noise, so if you're catching household noise now, you should notice a definite improvement with the low noise antenna.

>If so I'm wondering if maybe the ICE 180A isn't transforming
>the signal quite right. I was thinking one benefit of the Doty
>homebrew transformer is that one could tweak it for a better
>match by changing the windings.

The ICE 180A has feeds for 4 different input impedances (something like 350, 400, 500 and 600 ohms?) to match most antenna conditions (but I haven't played with them yet). I've opened mine up and to my non-technical eyes it looks very well made, with a surprisingly thick metal case. It also has some static discharge

protection, which is a nice plus.

Hope this helps!

Regards
from Ottawa

Topic: 1534 Message: 1534

Hello ICOM IC-R75 fanatics,

I'm just wondering if anybody has modified their R75 to receive AM Stereo signals using its built-in Motorola MC13022 C-Quam decoder chip.

I think it may be as simple as tapping into the MC13022's Left and Right audio output pins (currently unused by the R75), but I don't know if the way the chip is set up to provide Synchronous Detection is going to affect how it receives AM Stereo signals.

Other communications receivers such as the Sony ICF-2010 and the Grundig Satellit series that use Sony's CX-857 multi-system AM Stereo decoder chip for Synchronous Detection have been successfully modified to receive AM Stereo, however the Sony chip works in a quite different manner than the Motorola chip.

AM Stereo is also useful on the LF/Longwave and HF/Shortwave in that it can be adapted to receive Independent Sideband (ISB) audio, where the lower sideband of the signal is in the Left audio channel and the upper sideband of the signal is in the Right audio channel. There have been assorted experiments with AM Stereo broadcasting on the Shortwave bands using both the Motorola C-Quam (Compatible Quadrature AM) system and the ISB system (otherwise known as "Kahn/Hazeltine" when it was used on the AM/MW broadcast band in the 1980s).

Howdy, Bud! Right here down the road in San Lorenzo!
Also a Kiwa-modified R75.

Reception here is actually pretty good with very basic antennae. I use an Alpha Delta DXUltra, which is essentially a slightly-inverted V triple dipole with traps for the longest waves, and a 65' random wire. Neither are very high - about 24 feet above ground. My radio is grounded with a basic 8' rod and 8 feet of #8 copper wire. Each antennae is good for various things; with these, I routinely receive 1kW (and occasionally lower) stations from Latin America and the Pacific. Radio Republic Indonesia, with its panoply of micro-stations, is well-heard around these parts, as is Brazil, Ecuador, Bolivia, Peru et al. Africa is the toughest, although certain stations in South Africa, Zambia, Tanzania and western Africa are surprisingly regular; but south central Asia is surprisingly good. Amateur radio ops from that part of the world are not infrequent, and amateurs are regularly heard from Africa and Europe, even QRP operators.

You'll love this little radio! It's a keeper!

No. the Sat 800 does not use the same method for sync detection. However, back to the original question... Has anyone looked at the unused pads next to the Motorola chip in the R-75? Could they be for the extra components to do AM stereo? (These can be seen in the PDF for the 1.1 mod.)

Craig

Nobody that I know of.

> I think it may be as simple as tapping into the MC13022's Left and
> Right audio output pins (currently unused by the R75), but I don't

Well, it will require more connections than that. You can check the R75 schematic which you can download from the "Files" section of this group (the datasheet of MC13022 is also in the "Files"). Connections to pins 16,17, 18 and 26 will be needed. Making it decode C-QUAM is possible but I am not sure if it is worth the modification work.

> AM Stereo is also useful on the LF/Longwave and HF/Shortwave in that

This is not so easy to implement with MC13022. It has Phase Shift Network (PSN) but it is wired not in a "correct" manner. One of the inputs of the matrix is connected to the envelope detector (1+L+R) the other input is connected to the Q-detector (L-R). To make sideband selectable synch. detector ... or ISB stereo receiver ... an external PSN has to be added connected to the I-det and the Q-det (the outputs of these are available). I searched the electronics shops here but nobody has heard of PSN. Sony is producing such devices but they make them for their own production and do not sell them .... especially in the 1 or 2 quantity :-). The last resort is to make a PSN from discrete components.

Best regards,

Rado

> Making it decode C-QUAM is possible but I am not sure if it is worth
> the modification work.

Perhaps you don't understand that the MC13022 chip itself is the C-Quam AM Stereo decoder. On a regular radio, the '022 would be all you need to receive AM Stereo.

What the R75 does is basically apply a "mod" to the way the MC13022 is used to provide sychronous detection. This can be done with other Motorola C-Quam decoder chips as well, such as the original MC13020.

Therefore, getting an R75 to receive AM Stereo would probably be as simple as tapping into the MC13022 chip's Left and Right audio outputs, which are provided directly at Pins 10 and 11, respectively.

One communications receiver that provides BOTH Synchronous Detection AND AM Stereo support is the JRC (Japan Radio Co.) NRD-545 DSP. I don't know what system the NRD-545 uses to do this; as the same suggests, it may simply use Digital Signal Processing to do everything, so then it would only be a matter of computer code to manipulate the received signal, instead of electronic components.

An excellent web site to visit for more information on both AM Stereo and Synchronous Detection (and how they work together) is this one, "The AM Stereo Tech Zone":

http://www.hal-pc.org/~jsgil/AM-Stereo/

It focuses mainly on the original MC13020 C-Quam decoder chip, which is the easiest to convert to Synchronous Detection but does not offer the best performance for AM Stereo reception. The newer chips such as the MC13022 have vast improvements in AM Stereo sound quality and reception, especially in weak signal conditions, but are somewhat more complex both to implement and to adapt to Synchronous Detection.

I understand that perfectly. English is not my mother tongue so maybe I am
not expressing myself correctly.

Sure.

> Therefore, getting an R75 to receive AM Stereo would probably be as
> simple as tapping into the MC13022 chip's Left and Right audio

Not as simple. As I said before - some additional components have to be
added. A low pass filter between pin 26 and pin 18. This will feed the pilot
detector of the IC. As it is in R75 the pilot detector is not fed ... i.e.
it will never detect the 25Hz C-QUAM pilot. Until it detects the pilot it
will not switch (un-blend) to stereo - the audio on pins 10 an 11 will be
mono even if the station is stereo. Some caps have also to be added to pins
16 and 17. Also I assume that the receiver has been already modified with
the synch mod. This means pin 23 "blend" has been lifted (in the original
R75 it is grounded i.e. solid NO to stereo output) and connected to
appropriate capacitor.

> http://www.hal-pc.org/~jsgil/AM-Stereo/

Thanks for the link!

I am not a stereo AM fan. If I was I would have tried it with my R75 already
:-).
I don't know of stations around here (Japan) that transmit in stereo.

Regards,

Rado

AM Stereo is actually quite popular in Japan. It is probably the country that has the most AM Stereo radios available. For some reason, companies like Sony and Aiwa make AM Stereo radios for the Japanese home market, but do not sell them with AM Stereo capability in the USA, even though hundreds of American stations broadcast in AM Stereo!

Anyway, the following stations in Japan are known to be broadcasting in AM Stereo. The number in the list is the station's power level, in kilowatts (for example, "100" = 100 kW = 100,000 watts).

954 JOKR Tokyo, Japan 100 "Tokyo Hoso" (TBS)
1008 JONR Osaka, Japan 50 "Asahi Hoso" (ABC)
1053 JOAR Nagoya, Japan 50 "Chubu Nippon Hoso" (CBC)
1134 JOQR Tokyo, Japan 100 "Bunka Hoso" (NCB)
1179 JOOR Osaka, Japan 50 "Mainichi Hoso" (MBS)
1197 JOBF Kumamoto, Japan 5 "Kumamoto Hoso" (RKK)
1242 JOLF Tokyo, Japan 100 "Nippon Hoso" (NBS)
1278 JOFR Fukuoka, Japan 50 "RKB Mainichi Hoso" (RKB)
1287 JOHR Sapporo, Japan 50 "Hokkaido Hoso" (HBC)
1314 JOUF Osaka, Japan 50 "Radio Osaka" (OBC)
1332 JOSF Nagoya, Japan 50 "Tokai Radio Hoso"
1350 JOER Hiroshima, Japan 20 "Chugoku Hoso" (RCC)
1413 JOIF Fukuoka, Japan 50 "Kyushu Asahi Hoso" (KBC)
1431 JOVF Wakayama, Japan 5 "Wakayama Hoso" (WBS)
1440 JOWF Sapporo, Japan 50 "Sapporo TV Hoso" (STV)
1494 JOYR Okayama, Japan 10 "Sanyo Hoso" (RSK)

An MP3 recording of 954 JOKR (TBS) as received in AM Stereo can be found at:

http://musicandvideo.myftpsite.net/amstereo/files/stations/Asia/Japan

There are AM Stereo stations in other parts of Asia as well, including South Korea, Hong Kong, Taiwan, the Philippines, Thailand, and Indonesia.

For the complete worldwide listing of AM Stereo stations, see the Official AM Stereo Web Site at: http://www.AMStereoRadio.com

When you put in an optional filter does that bypass the pre fitted filters.I am going to put in a fl-100 9mhz cw filter 500hz.if the pre fitted filters are not bypassed do i set the 455khz filter to the lowest 455khz filter fitted.

From: vk4zss
Topic: 1544 Message: 1546

installing the 500Hz 9MHz 2nd IF Filter does not bypass the other 9MHz filters per se - it just gives you an extra 9MHz filter to choose from when setting your filter selections for each mode, in wide/normal/narrow. when you select the 9MHz 500Hz filter in any mode/bandwidth combination, always choose the narrowest available 455kHz 3rd IF filter provided that its bandwidth equals or exceeds that of the 9MHz 500Hz filter. that will give you the best close-in dynamic range possible with the set. ideally the 9MHz & 455kHz filters should be of identical bandwidth for best possible skirt selectivity, but icom chose not to offer enough xtal option slots to make this prossible for several bandwidths

Based on the poll results, I would suggest that the status quo remain and no changes be made. I will remove the site which had the message forums.

Down the road should anything change, feel free to drop me a line and I can see what I can do if the needs of the group change.

Rick

hi peoples!

i posted the first version of my 'R75 Cookbook' in the Files -> Information section. It is a nine page, 100 kb PDF called 'PhilCook.pdf' it is sort of a users manual i have worked on for quite some time. take a peek... if you're new you should find a lot of useful information; hopefully everyone can get something from it. find any errors? drop me a line.

regards,
phil :)

Hi, Phil - just gorgeous. However, to give proper credit where it is due, the "Super DXing" method that is attributed (I think) to me is actually something that Mr. Michael Bryant developed one day and shared with all of us. I believe I just repeated it for the benefit of another group. It is rather amazing - the number of heterodynes one hears multiplies like rabbits as compared to keeping that AGC on!

Help... I never have really understood the filter set-up on my R-75.
Reading Phil's Cookbook (great guide, by the way) settings are
described as AM Normal, AM Narrow, etc. When I go into filter setup
I have a dislay for 9M and 455K in normal, narrow, and wide modes.
What is the differance between the 9M and 455K filters and how can I
set these to match Phil's recommendations??

Thanks,
TH

hi TH:

look at the filters i suggested and then program them in like this
example of SSB...

Press 'SSB' (or whatever mode you want to setup filters in).

Depress 'FIL' 2 seconds (9M will be displayed).
Turn the dial until '2.4' is displayed.

Press 'UP' (455K will be displayed).
Turn the dial until '2.4' is displayed.

Press 'UP' (9M with an 'N' meaning narrow will be displayed).
Turn the dial until 'oFF' is displayed.

Press 'UP' /until/ 'EXP' is displayed.
Turn the dial until 'oN' is displayed.

Press 'UP' until 9M with a 'W' above it (meaning WIDE) is displayed.
Turn the dial until '15' is displayed.

Press 'UP' (455k with a 'W' will be displayed).
Turn the dial until '6' is displayed.

Press 'FIL' to exit.

phil :)

From: sarmento2k
Topic: 1568 Message: 1568

Hi People

Could someone explain me why we can turn off the IF 9M or 455k ?

I mean, what are the benefits of working just one IF instead of both ?

Using just one IF we could manage better the filter setup ?

In this case we would have less sensivity or selectivity ?

Thanks for your attention, I´m a beginner !

1571. R75 Software I'm working on

Yahoo group: icomr75 (2000 — 2002)
Date: 2002-05-10 01:27:51 UTC
From: jgedde
Topic: 1571 Message: 1571

Hello all,

After reading that Icom wants $60 for their software to control the R75, I figured I'd let the cat out of the bag now...

I've been working on a Windows program to control my R75. It's called R75 Executive. It's not
done yet, but is well on its way. I'll probably give it away for free, just not the code....

What I will say is that it's written in Visual C++ using MFC. No buggy VB application here...

I've uploaded a screen shot of what I have so far (photos section). All of the
controls you can see are working. In addition, from the tools menu you can sync the R75 time with your PC clock, and set all of the options available via the "set" key, but in a much more user friendly fashion.

Notice there is no menu for COM port setup. I have implemented an automatic routine where the software searches available COM ports for the R75 and automatically sets baud rate.

I have had the software running for well over a week constantly, and it hasn't yet crashed.

The one thing I have not yet implemented is memory stuff, "easy" station logging (times, QSL database, SINPO, and much more), spectrum analysis, and maybe even audio DSP (audio notch, equalization, companding, noise reduction, etc).

Other idea I have are IR remote control, network control, and a OLE Automation interface to allow control of the R75 from other applications. One could use this to put an R75 on the net...

Let me know what you all think, as well as any comments you may have.

Also, please send me any ideas you have for functionality I haven't thought of.

In addition, please let me know if you want a BETA release version to try... It will run on NT,98/ME/2000/XP and probably 95. I am using some multithreading stuff and exception handling that may not work right under 95. The only way to know is to try... I don't have a Win95 system to try it out on.

Thanks,
John Gedde

1572. Re: [icomr75] R75 Software I'm working on

Yahoo group: icomr75 (2000 — 2002)

From: Ian Johnson
Topic: 1571 Message: 1572

John

I see a tuning knob as being necessary, especially for ECSS work. Or at least a +/- control from set frequency.

Also, a query. Can you bring the audio back to the PC?
If I were to use it I would have some distance between PC and R75. I wonder what distance RS232 tolerates?

Otherwise it looks like very nice work. Thanks for sharing it.

Best Regards

Subject: [icomr75] R75 Software I'm working on

Hello all,

After reading that Icom wants $60 for their software to control the R75, I figured I'd let the cat out of the bag now...

I've been working on a Windows program to control my R75. It's called R75 Executive. It's not
done yet, but is well on its way. I'll probably give it away for free, just not the code....

What I will say is that it's written in Visual C++ using MFC. No buggy VB application here...

I've uploaded a screen shot of what I have so far (photos section). All of the
controls you can see are working. In addition, from the tools menu you can sync the R75 time with your PC clock, and set all of the options available via the "set" key, but in a much more user friendly fashion.

Notice there is no menu for COM port setup. I have implemented an automatic routine where the software searches available COM ports for the R75 and automatically sets baud rate.

I have had the software running for well over a week constantly, and it hasn't yet crashed.

The one thing I have not yet implemented is memory stuff, "easy" station logging (times, QSL database, SINPO, and much more), spectrum analysis, and maybe even audio DSP (audio notch, equalization, companding, noise reduction, etc).

Other idea I have are IR remote control, network control, and a OLE Automation interface to allow control of the R75 from other applications. One could use this to put an R75 on the net...

Let me know what you all think, as well as any comments you may have.

Also, please send me any ideas you have for functionality I haven't thought of.

In addition, please let me know if you want a BETA release version to try... It will run on NT,98/ME/2000/XP and probably 95. I am using some multithreading stuff and exception handling that may not work right under 95. The only way to know is to try... I don't have a Win95 system to try it out on.

Thanks,
John Gedde

One other thing.... After looking at the screen shot, you may be wondering why the SMeter reads almost 10, but the SMeter digital display shows +6.6. This is because the signal was at +6.6 dB OVER S-9.

The number the R75 returns is two BCD bytes containing the SMeter reading from 0 to 255. Its count does not directly correspond with any SMeter reading. So, I use a non-linear function to convert counts from S-0 to S-9 to display S-0 to S-9, and over S-9, I use another nonlinear function to convert to db over S-9.

I believe someone once asked about the relationship between counts and S-Meter reading, so here is the code I use:

```
double CR75ExecutiveView::GetSMeterFromBuffer(unsigned char* buffer)
{
double retval=0.0;

retval+=(double)BCDToDecimal(buffer[0])*100.0;
retval+=(double)BCDToDecimal(buffer[1]);

if (retval>=153.0) // Over S-9
retval=33.862738+(0.17608924*retval)+(-1186200.7/
(retval*retval));
else //Under S-9
retval=5.2079+(5.2644*cos((0.01794265*retval)+3.15348));
#ifdef SHOW_STATUS
TRACE("SMeter: %5.1f \n", retval);
#endif
return retval;
}
```

Hello John
I run my R75 from a AMD K7/500 win98 machine. I have both the Icom software (ugh) and the SmartIcom software (better). It would be interesting to try yours as well.
I am willing to try your beta version if you have the need.

Ian,

I haven't yet added a tuning knob, but I will. I've been thinking over actually how I am going to design the user interface. I want to provide more flexibility with regard to tuning steps than the R75 provides...

Bear in mind, this software is still very much work in progress... Your idea give me food for thought...

As for audio, it can't be taken digitally over RS232, so you'd have to run a audio cable from the R75 to your PC line in, or use a remote speaker. Maybe one of those wireless jobs...

I saw your post was from Austrailia. Despite the fact that you all speak English down under, it brought to mind another thought. Internationalization. Eventually I could load all of the screen text from a language resource to have it work in multiple languages...

Cheers,
John

hi John:

impressive!!!... MFC, automatic baud detection. if you feel like it
you could add 'get time' and update UTC via the naval observatory's
nuclear clock using CSocket. i think your program looks great!

phil :)

Cool idea, and not too hard to do either. I'll add it as a bell and whistle sometime...

Thanks John

Also, maybe the PBT labelling could be 9MHz and 45xKHz rather than outer and inner.

We still speak English of a sort down here....

No comment on maximum length of RS232 cable?

Cheers
IanJ

Hi John,

The software looks really nice!
About the tuning knob - I always wanted a software which can use the scroll wheel on the mouse as a tuning knob.
Waiting to try your first beta.

Best regards,

Rado

The maximum length depends on many factors. Quality of the cable, impedance of the drivers/receivers. It can be as little as 15 feet, or can work up to 100 feet+.

For longer distances, using a RS422 converter at each end can allow up to 1500 feet.

I think that do-able, if the mouse is positioned over the tuning
knob...

This topic was covered a few months ago so you can do a search if you want the details, but for a quick recap of the story:

I was experiencing computer noise while playing around with conputer control of my R-75 so I hooked about 6-8 DB9MF extension cables together and put the radio in another room about 30 feet away. I then twisted a pair of 22 AWG wires for about 40 feet and put 1/8" mini plugs on either end and plugged the audio out of the R-75 to the audio in of the computer. Everything worked perfectly.

I think the original spec for RS-232 was 12 feet, it's been changed numerous times, but 20-30 feet is almost always reached without a problem and ther are some extreme cases of people using it for hundreds of feet or more. If you made a custom length cable with shielded wires, you can probably run it across any length of your house. Same with the audio cable. In the worst case, you could lower the baud rate and boost your range, or get a pair of 232/422 converters.

We at Gould, in 1985, ran 2000 feet at 9600bps using Belden 3 pair
wire. (Don't recommend it, but that's 'cause our wires ran outside
and picked up LOTS of induced EMF during lightning strikes, frequently
obliterating RS232 drivers in VT100s and Gandalf switches.)

Don't ask why we did it that way... it's a Dilbert kind of story...

If you can use two computers, you might want to consider Windows Terminal Server, or Remote Desktop in Windows XP. The really hot set-up would be to use a standard length of RS232 cable to a Windows XP box, put that machine on a wireless network hub and control your R75 via Remote Desktop from a wireless networked laptop or iPaq. If the control software would bring the audio back to the soundcard on the serially connected computer, XP will re-direct that audio across your network to the laptop. Alternatively, you could use a low power FM transmitter to re-transmit the audio to a walkman or home stereo equipment. In that way, the R75 becomes virtualized throughout your home.

If you know your ISP assigned IP address, and have a home router / firewall, you can "punch a hole" through it and use remote desktop connection from any Windows NT / 2000 / XP / or probably 95-98 machine to get back to your control machine at home regardless of where you are in the world via the Internet. Of course, this pretty much only works with digital modes unless you can bring the R75 sound back to the sound card (or re-broadcast through a really HIGH powered FM or AM transmitter . . . but that would be a bit of overkill huh?). Soundcard re-direction does work across fast internet connections, though it is a bit choppy at times.

Example of how this can be used: If I am at work, I can use Remote Desktop to get back to my home machine, bring up the free version of Fineware, turn on the R75, tune it, set the mode, etc, bring up Digipan or MSSTV and monitor PSK31 or slow scan TV from the virtual desktop on my work computer . . . during my lunch break only of course ;)

Something to think about.

KØADL

Already done.

http://www.ralabs.com/webradio/

... and putting a cable that runs from the audio out to the audio in on your PC's soundcard makes WinPSK decode PSK31 if you tune to the PSK31 frequencies on the web radios! The only problem is that it is a public (open) site and anyone can change the frequency at any time. On top of that, N2JEU disconnects the radio's during thunderstorm season :(

1588. ANN: tk75, new open source software for IC-R75

Yahoo group: icomr75 (2000 — 2002)
Date: 2002-05-11 03:13:53 UTC
From: Bob Parnass, AJ9S
Topic: 1588 Message: 1588

I wrote tk75, a new open source computer program which lets you:

(1) Control the IC-R75 from your computer.

(2) Download/upload the radio's memory channels from/to a
csv (comma-separated values) file.

(3) Log active frequencies, intercept time, and relative signal
strength automatically while scanning.

(4) Easily access radio controls which are buried
within the radio's menus, e.g., DSP Noise Reduction level.

Though I've all but abandoned Windows 98 in favor of free Linux,
I wrote tk75 in a language (Tcl/Tk) which permits it run on either
operating system. It will probably run on Windows ME, Windows 2000,
Windows XP, MacOS X, Solaris, FreeBSD, and other environments,
but I've only tested it on Linux and Windows 98.

You can read about and download a beta test version of tk75
from my home page:

http://members.core.com/~parnass

I don't warrant the software, but it won't cost you anything.

Thanks to Bob Grove for the loan of an ICOM IC-R75 receiver
so I could design and test tk75.

The two BCD bytes my R7100 return definitely coincide with an S-meter reading. 3 on the SMeter of the R7100 corresponds to 30, S9 corresponds to 90 etc. Maybe its just for the R7100 though.

:-)

You didn't say what the exact error message was, but
if it was something like:

tk75.tcl: error: Environment variable tk75 must
be set to the directory containing the library
files for program tk75tcl.

it means you need to add the the SET tk75=C:\tk75 line
to your C:\AUTOEXEC.BAT file and reboot, as detailed
on this page:

http://members.core.com/~parnass/tk75/dl4win98.html

Perhaps you missed that step or forgot to reboot.

Well then, they're SLOW, and they don't provide low-level code that the debugger can walk through when an exception occurs.

I wrote a FIR DSP filter in VB 6 a year or so ago, that, when written in C++ runs 40-50 times faster. This is because it doesn;t have to run through VB's OLE subsystem and can be compiled to REAL native code that doesn't need 20 DLLs to run...

Furthermore, the MSCOMM.OCX control has never worked well since they introduced it. With high bandwidth, the control causes an access violation (which VB ignores with no indication to the developer) and just stops responding. In VC++ the same situation occurs, but since it's caught, the control can be re-instatiated and invoked again.

For the R75 application, I ended up wiring my own serial port class that runs circles around MSCOMM and hasn't yet crashed (since I worked the bugs out of it)

If you get a GPF in VB what do you do about it? You fire up the VC++ debugger and step through assembly code to figure it out. Not my idea of a good time...

I have exactly this problem at work. I developed an instrumentation interface as an ActiveX control for use in a VC++ application. The VC++ application runs flawlessly, but the VB control has a problem I can't track down because I have no indication of what the compiler created from my VB code. Somewhere it's type-casting a double to a single internally, and causing a loss of precision, causing the floating point unit to fire an exception inermittently on control termination.

I also have to disagree with the statement that VC++ and VB are similar. VC++ and MFC are so far beyond what VB can do, it's unbelieveable.

I was a VB programmer for many years before I learned VC++. Now, I'll never go back. Just take a look at Appelman's Win32 API book for VB and see the set of API calls that VB can't make...

All the things I can do VC++, that I can't do with VB are overwhelming. You can't even begin to develop a low level device driver with VB. VC++ can with ease...

API calls are much easier, with VC++ I have access to memory by pointers, multithreaded applications with anything other than the apartment threading that VB supports, custom Windows messages, and MUCH MUCH more. Some of these things can be done in VB, but are a

hassle and require esoteric techniques, and sometimes third party
ActiveX controls and/or C DLLs to implement.

Only for Databases and RAD small quantity software do I see an edge
with VB.

Regards,
John

hi John:

i've been there too. VB is popular now that $600 will buy 1 GHz and 256 MB. i am not fond of VB's need for runtime DLLs. i have spent plenty of nights arguing programming languages... BASIC and C++ holywars etc... 'BASIC is slow, non-portable bloatware'... language or implementation? BASIC was created as a compiled language and is fairly portable. war continues: the C crowd then calls C++ slow OOP 'fad' bloatware. the C++ loyalists call C 'spagetti' and then ask 'what is multiple inheritance?' the assembly crowd then steps in to tell the C people they too are wimps, hypocritical wimps at that. the C crowd fires back 'portability'... meanwhile 80% of those arguing are pushing around win api calls. plenty of us battling can do them all... but hell we like to argue lol.

```
cout << "please point darth in the direction of the war" << endl;
mov [war], darth ; actually this is possible with EQU's
```

i am a compiler junkie: i like BASIC, C, C++, and assembly. since it's a hobby i can 'do what i want'... like use a win32 api BASIC compiler that allows inline assembly or do win32 api assembly. ever do any COM in assembly? oh what fun... :D.

i know a bit about Dr. John Kemeny and this alters my perception of BASIC. he created BASIC six years before C... five years before intel made the first microprocessor: the 4004. he detested Gates and Allen's interpreted version of BASIC. Kemeny was a genius who came to America at age 13, his family escaping the nazis. he went on to become Albert Einstein's math assistant... as he put it (if memory serves me): "Einstein did not need help in physics but contrary to popular belief Einstein did need help in mathematics". Kemeny worked with John von Neumann in the computer center at los alamos... later he taught at Princeton... then became president of Dartmouth where he helped open the school to minorities and women. he envisioned a world where everyone could be a programmer... made BASIC, and the rest is history.

phil :)

1598. decision - ICOM 718 versus R75

Yahoo group: icomr75 (2000 — 2002)
Date: 2002-05-12 18:06:01 UTC
From: david_ballenger
Topic: 1598 Message: 1598

Would like to get the benefit of someone's opinion who has experience with both radios. I have a tech license and would like to get a general license in the next year or so. In the meantime, I would like to get a good general coverage receiver. Are the receiver section and features on the R75 markedly better than those of the 718? If so, with the price of the R75 at about $550 plus the bonus DSP unit, I am tempted to get that in the meantime. If the receiver in the 718 is nearly as good, however, I might as well go ahead with the 718 for the same price (except for having to purchase an external power supply).

Thanks in advance for your opinions.

David Ballenger

I have them both. They make a really nice pair for sure. I bought my 718 first, had it for about two years and just bought the R75. I would get a 718 before the R75 because the receiver section is very good in the 718 -- you get a general coverage receiver, but no 50 MHz or above in it like the R75, and no FM either. I bought the R75 so that I could monitor two frequencies at once with two very good receivers. Can I tell much difference between the two receivers? Honestly - NO. The R75 offers more features, and if I am really trying to pull out a very weak signal, or if I want to enjoy listening to the hi-fi SSB guys on 14.178, I will use the R75 every time. More features, S-AM (that works after you do the mod), twin pass-band tuning, etc. in the R75.

If you are going to upgrade to General or higher, and can only afford one rig right now, buy the 718. Later on, get the R75 . . . they look great together in your shack and you will put the R75 to good use for hunting DX. Plus - you can put a simple mono audio cable between the "remote" jacks of both rigs and use them in what Icom calls "Transceive" mode. Moving the dial on one rig changes the freq on the other rig too. Using two rigs like this is VERY nice for when you are working "split" with the 718 and want to hear what is happening on the receive frequency (hearing on the R75) while you are transmitting (on the 718).

Both are nice radios - packed with features for a small price (compared to other rigs), but I would get the 718 first. There's about three times as much hardware in the 718 (of course) for about the same cost, so dollar for dollar the 718 is the better buy (or at least pound for pound) -- and you can get on 10 meters with the Tech + code certificate right? Pass an easy 5 WPM code test, put up a dipole cut for 28.4 Mc and USE the transmitter section of the 718!

KØADL

would like to get a good general coverage receiver. Are the
receiver section and features on the R75 markedly better than those
of the 718? If so, with the price of the R75 at about $550 plus the
bonus DSP unit, I am tempted to get that in the meantime. If the
receiver in the 718 is nearly as good, however, I might as well go
ahead with the 718 for the same price (except for having to purchase
an external power supply).

Thanks in advance for your opinions.

From: jim_hack
Topic: 1600 Message: 1600

Well, today I performed surgery on my R75.
I did all 3 of Rado's mods for the sync, agc, pll speed.
I am VERY happy to report that the "victim" pulled through.
It cost me $4.32 and about a half-hour of my time.
I am NOT very electronic saavy, although MANY decades ago in high-school, I built a few projects. Transistors were THE rage back then ;)
If a guy like me, who can't see anything closer than arms length can do this mod, ANYONE can.
Oh yea, it made a world of difference!
Especially the AGC mod. I didn't see the Synch mod as a neccesity, what with the ECSS method at my disposal. I have been using it and it actually does something now!
Time to turn off all my RFI inducing items and listen to the world...

1601. New IC-R75 owner joining the list

Yahoo group: icomr75 (2000 — 2002)
Date: 2002-05-13 21:36:51 UTC
From: ondatropical
Topic: 1601 Message: 1601

Greetings from a new R75 owner. I have recently returned to the DX hobby after a lengthy absence and after due consideration decided on the R75. I am really impressed with this receiver and it defintely holds its own with my last DX rig, the venerable NRD-535D.

My main interests are MW/Tropical Band DX and the capability of the R75 to allow precise 1 Hz frequency measurements along with the ability to view and monitor weak carrier signals down in the mud with a software spectrum analyzer is a wonderful tool for the DX'er.

With my setup I am using the R75 in conjunction with Spectrogram v6.6 audio spectrum analyzer software and a 10-band graphic equalizer for precise frequency measurements and in less than one evenings practice I am able to accurately determine carrier frequency to to the nearest Hz. After calibrating the receiver with WWV with the help of Spectrogram, I verified the accuracy against the transmissions on each of WWV's frequencies and in each case it is perfect. Fortunately I purchased the R75 with the High Stability Osc. and after a very small warm-up period it is rock solid.

Thanks to the folks who made this list possible and best DX to all list members.

73.

Brandon Jordan
Memphis, TN

Topic: 1568 Message: 1603

You don't really turn it off. You just bypass all the crystal filters for that IF, leaving you with a 15kHz bandpass. The only reason you would do this is because you don't have a wide enough filter to accomodate the width of the other filter. Generally speaking, you want to choose the narrowest for both filters that give you the bandwidth you want, the resulting bandwidth being the minimum of the two. This gives you the best selectivity and lowest noise.

1604. tk75 v0.2 now available, open source IC-R75 software

Yahoo group: icomr75 (2000 — 2002)
Date: 2002-05-14 14:17:24 UTC
From: Bob Parnass, AJ9S
Topic: 1604 Message: 1604

tk75 version 0.2 is now available for free download.

tk75 is open source, multiplatform software for controlling
and cloning the ICOM IC-R75 tabletop receiver.

Changes include:
Limit Search and Auto Memory Write Search
Control of virtually every IC-R75 Set Mode setting, including
timers, RTTY settings, RF/Squelch knob, dimmer, etc.
Sync the radio's clock to the PC in local time or GMT
Comprehensive, easy to understand filter configuration
Improved CW pitch control.

I use the free and more stable Linux operating system
instead of Windows. But, I wrote tk75 in Tcl/Tk so it runs on
either operating system.

It will probably run on Windows ME, Windows 2000,
Windows XP, MacOS X, Solaris, FreeBSD, and other environments,
but I've only tested it on Linux and Windows 98.

You can read about and download a beta test version of tk75
from my home page:

http://members.core.com/~parnass

I don't warrant the software, but it won't cost you anything.

Thanks to Bob Grove for the loan of an ICOM IC-R75 receiver
so I could design and test tk75.

Are there any Mac OS 9 or X R75 applications available?

There are several RTTY decoders available for Mac OS X but no control applications for Icom receivers.

Using the Fineware software works great under VirtualPC with Windows XP on a Cube G4 running Mac OS 10.1.4.

I think the tk75 (IC-R75) and tk8500 (IC-R8500) programs
would work on MacOS X but I don't have a Mac and
cannot find anyone to try them on MacOS X.

All 5 of my tk radio programs use the same technology.
An NRD-545 owner who is also a Mac fan got
tk545 (NRD-545) working on his MacOS X laptop, so I
think it's possible to get all the tk programs working
on MacOS X.

He helped write this web page which discusses how
to get tk545 working on MacOS X:

http://members.core.com/~parnass/tk545/dl4osx.html

I think you could apply the same technique he used
on tk545. Please let me know what happens.

Thanks.

I can confirm that tk75 will start up but I can not get past the screen where it is looking for a serial port. This may be because a) This old iMac does not hjave a serial port and/or b) I have no r74 attached to this computer. Otherwise it run s up fine.

You will need to get fink to install the latest tktcl package as well.

Scott

P.S. This looks like great software. I will try it at home with openBSD as well :)

Scott,

Thanks for the info! From your description,
tk75 is behaving exactly as it should
when no radio is connected to your serial port.

Please let me know what happens on openBSD. It should work
well there if Tcl/Tk is installed.

1609. tk75 - openBSD success

Yahoo group: icomr75 (2000 — 2002)
Date: 2002-05-15 16:08:25 UTC
From: Scott Robson
Topic: 1605 Message: 1609

Hi All.

Testing on openBSD went well. If this works on openBSD it will work anywhere :) It works just fine apart from a small problem with permissions in accessing the serial port. Only root could do it. There is a work around for this and I will hunt it down sometime and let Bob know the details so it can be included in the README file or some kinda README.obscure_unix file.

I do have one complaint though. When I first ran the software it completely reset the radio to a bunch of defaults. It didn't change anything I couldn't set back but it was a little annoying to have to reset my timer to on etc (it switched it off and I panicked when I powered down the unit and the clock disappeared!). Is it possible to get the software to probe the radio for the radio settings and then construct the .tk75rc from that when it can not otherwise find a .tk75rc file?

Otherwise great software! I don't speak tk/tcl but I might have to learn so I can write some additions to this program.

Scott

Date: 2002-05-15 16:47:38 UTC
From: Bob Parnass, AJ9S
Topic: 1605 Message: 1610

Scott,

Thanks for testing tk75 using the openBSD operating
system and I appreciate your suggestions. tk75
reads some, but not all settings from the radio.
It's just a matter of adding the code to read all
the settings, and that will take some time.

I had to do a chmod 666 on /dev/ttyS1 serial device
port to grant user write permissions. Guess you
did something similar on openBSD.

I will add a note to the download web page.
Thanks again.

Hi all!
I have been an owner of the r-75 for over a year. I haven't done
a lot of mods, except for the DSP unit. I would like to get some advice for,
or on finding, cheap or no-cost, non-expert type of mods. I primarily use it
for AM SW listening, so stuff like S-AM mods, etc would be useful. Also, any
non-mod type adjustments would also be greatly appreciated.
Thanks in advance!

The manual actually doesn't say, believe it or not. However, setting one filter to narrow and the other to wide and determining which knob is effective will confirm that the inner is 455.

You guys obviously didn't check out the files section of this Yahoo
group now did you?

Shame Shame ;P

In there are a full set of schematics:
http://groups.yahoo.com/group/icomr75/files/Information/

go to the bottom and find the schematics.pdf file.

Have fun with them
Roy

Roy,

Thanks for the pointer to the schematics in the Files
section. That's a wonderful resource!

However, I wanted to know if Icom includes a paper
copy of the schematic with the IC-R75.

Thanks.

No schematic with my R75. However, my ICOM R8500
did come with one.

There seems to be no rhyme or reason to Icom providing
schematics. My R2, R10, R75, Q7A, W32A, 2800H ,
706MKIIG had no schematics included with the original
manual. My ICOM IC-746 did. Not too sure who's idea
it was to do away with the complimentary schematics but
they are indeed missed. I think with the new front panel
service menus that a Service Manual may now also be a
necessity for troubleshooting and alignment.

They may still offer basic schematics for free but I doubt it.
Icom was generous to my request in the past and copied
several pages of the schematics for the Original IC-706
many years ago.

By the way there are two things that work better on paper
for me and that is .....Road Maps and Schematics! Those
schematic .PDF files are slow to load on my computer and
when printed on my HP printer do not show enough detail.
I am sure with the proper large scale printer ($$$) they
would turn out fine. Better that nothing I suppose....

Also a THANK YOU! to (Dr.)Phil for that wonderful R75
Cookbook hidden away in the Files area. I just discovered
it tonight and am looking forward to using it.

Strangely enough my manual says the folowing on page 2:

5. Passband tuning controls (Twin PBT)
Adjust the receiver's "passband width" of the 455 kHz and 9 kHz IF filters for the inner and outer controls, respectively.

I assume it's a typo from Icom...:)

The Front Panel description on page 2 of my IC-R75 instruction manual
says the inner knob is 455 kHz and the outer knob
is the 9 MHz IF PBT.

Maybe there's more than one version manual.
The rear cover of my manual shows copyright 1999,
and an identifier of A-5580H-1EX-2.

I was looking at the page describing the PBT control in detail, which
describes it's operation correctly, but doesn't say which is which.
And Page 2 says which is which, but doesn't describe it correctly.
Good thing we have this forum.

1634. More R75 Screen shots uploaded

Yahoo group: icomr75 (2000 — 2002)
Date: 2002-05-21 01:10:22 UTC
From: jgedde
Topic: 1634 Message: 1634

I've uploaded more screen shots of my R75 Executive program. An ALPHA release is coming up. Things are coming along well.

I've kept a list of those who have emailed me requesting a BETA release.

Any comments are welcomed.

Cheers,
John Gedde

1640. R75 Dead!

Yahoo group: icomr75 (2000 — 2002)
Date: 2002-05-21 03:25:35 UTC
From: Art Burke
Topic: 242 Message: 1640

I came back from a 4 day trip, hooked up my R75 and nothing.
No screen, no audio, no nothing. I pulled off the top cover and checked the fuse, it's fine.
I notice that once in a while, unplugging and plugging the power cable, I see random LCD activity
come on the screen...

Anyone have any of these symptoms? I checked the DC voltage out of the adapter. Approx 19.7 volts.

Did it just die? It's only 2 months old.

Thanks for the help.
Also, if anyone can offer advice on what to do at this point, it certainly would be appreciated.

Thanks much,

Art

Hi Art,

I had the same symptoms with mine once. Do not panic! I think the CPU goes crazy.
Open the set, remove the button lithium battery (clock backup), connect the power cable and turn it on. It should turn on fine. Then turn it off, reinstall the battery and check again.

Hope this helps.

Regards,

Rado

One more thing - did you try the reset procedure from the manual (while pushing "UP" and "DOWN" buttons push the POWER button)? I tried this when my radio went crazy and it did not work.
Also, while removeing the button battery take care not to short it. Do not use metal forceps! Also be carefull not to touch it with bare fingers. Fingerprints on such batteries can generate higher discharge current than the internal leak current. If you have some gloves and plastic pincers use them.

Regards,

Rado

Look for the small pinkish/orangish warranty card that should have
been in the box. Assuming you're in the US you will have to ship it to
Bellevue, WA.

1647. R-75 Antenna

Yahoo group: icomr75 (2000 — 2002)
Date: 2002-05-22 12:54:18 UTC
From: DFW1417
Topic: 1647 Message: 1647

Since I got my R-75 with the DSP about a year ago I have not been happy with it! It just seemed like it was so differentand quiet and bassy tone compared with other receivers I had for shortwave in the past. (DX-160B for 1).

Anyway I was thinking of selling it when I came across the Broomstick Antenna while surfing. Being cheap I decided to alter it a little. I used 16 ga pvc covered wire I had a 500' spool in the shed. Instead of a round PVC pipe I used a 2" x 3" x 6' length of plywood I had under the porch. I wrapped the board from top to bottom with coils of wire running the start and end parts to the bottom and used black electrical tape to cover it. I connected the ends to a 6' length of RG-58 coax and soldered it then taped it also.

I really had doubts about it. I ran this coax to my MFJ Antenna Tuner which then goes to the R-75. It cost me NOTHING to make this but time.

WOW! This has blown me away! I get WWV on 2.5Mhz clear and I never used to even hear it. I have monitored Hams on 40m and 20m bands which I never heard. It is SUPER NOW! I found if I select the Wide filter for AM tuning the tone is also MUCH BETTER!

When I stopped to figure it out here is what I had done.

I estimated each turn of wire on the board was 3" x 3" x 2" for a total of 8" for each turn. There were 50 turns for every 6". So I had 400" of wire for every 6" of board. I had 12 sections of 50 turns so I had 4800" of wire top to bottom when figured out to 400 feet of 16 gauge wire coiled on this form. I can use the antenna tuner and tune throughout the band to match the antenna and peak the signal on the R-75 signal meter.

NOW I LOVE MY R-75! I even listened to it this morning, I never used to be able to get CRAP in the mornings, now its SUPER! This is an ideal antenna for me and above all I have it BEHIND MY BOOKSHELF in the house. No outside wires or nothing! This would be great for anyone in an apartment or house for that matter that wants a great antenna and not outside. BE SURE to use an ANTENNA TUNER to get the maximum out of it. MFJ has a small one for about $50.00 with a switch on the left and adjustable pot to the right, I think it was model 16010.

Hope this helps someone!

Wayne.

From: DFW1417
Topic: 1647 Message: 1649

I was using an outside ground plane 30-1300 Mhz into the antenna tuner then through a preselector into the R-75. I also had tried about 20 ft of wire down behind the desk. I really did'nt want to put up another outside antenna so I was trying to use what I had already in place.

From: DFW1417
Topic: 1650 Message: 1651

There are certainly the more elaborate ones which are made for transmit and rated by the maximum wattage they can handle. However any antenna tuner can be used equally well on the receive side. If you are only using it for receive then by all means go with the cheaper version.

But to simply answer your question they match the antenna to the unit whether it be a receiver or transceiver thus giving you better reception and in the case of one made to handle say 200 watts transmission as well. There are also automatic antenna tuners out there which automatically retune the antenna match depending on the transmitted frequency into them, thus allowing you to use a single antenna on many bands while maintaining a good SWR match for the transmitter.

Also you can use a preselector which allows you to tune maximize the signal from the antenna to the receiver by frequency. Most preselectors will also provide some sort of RF adjustable gain amplifier in their unit as well. The preselector to my knowledge ONLY works on receivers though.

Wayne.

From: njlar
Topic: 1650 Message: 1652

Theoretically they help in receiving. As a practical matter the R75 is so sensitive you don't need one. Any reduced signal through mismatch is easily made up by the R75s sensitivity, and since the noise is increased along with the signal, the S/N ratio is not changed by a tuner. My experience with a cheap one I picked up on eBay was while it might have peaked up a few dB on some frequencies it lost a few on others even when tuned vs. taking it out. And in all cases the signals were readable either way, so I figured the tuner wasn't worth it.

As for pre-selectors, I don't have a problem with nearby broadcasters, so I don't know if they help in that case, but in general not needed. And you absolutely do not want a pre-amp with the R75 that already has two. A pre-amp could actually hurt by causing overload in the front-end.

Clearly your problem was the antenna, not the R75.

Geez, no wonder it didn't work very well! That antenna wasn't meant for s.w. That is a VHF/ scanner setup. I have tried MANY different configurations with my R75, Best set up so far being a 60ft long, 12 gauge wire fed by coax into my set with the set being hooked to a 6 ft ground rod.

Do you have a transformer to match the antenna to the co-ax?

You are not allowed to feed a low impedance load with a high impedance generator. It ain't natural.

From: njlar
Topic: 1647 Message: 1659

Try the high impedance input and see if that works even better, with a ground wire going to the ground connection. But if it's not any better, that's OK - we won't report you to the IEEE police.

Many people feel it's better to use the coax input with the coax being run outside away from the house and the shield grounded. Then hook whatever antenna you have to the center conductor. This eliminates a lot of noise which provides much greater benefit than having a good match into the high impedance inputs.

For what it's worth, after much messing around, I ended up with an Alpha-Delta Sloper, based on recommendations in this forum. Costs about $60, which isn't much additional to get the best out of a $500 radio. The advantage of this antenna is that it has a low angle of attack which is good for DX. As soon as I put it up I was able to get RNZI on 17MHz in NJ. It also happens to be resonant (i. e., impedance close to 50 ohms) on multiple frequencies. Only one end, where it is fed, needs to be up high; I hauled mine 25 ft up into a tree. For any kind of long/random wire as well, I think that feeding it from coax up high might be beneficial.

This is really right. I have an MFJ-1026 antenna phaser/noise canceller that involves the use of a second aux noise antenna. It is an excellent device, works well, but has a preamp for the auxiliary noise antenna. Sometimes one needs this dedicated preamp for the noise antenna to be able to match noise signal strength, but then, turning off one or both preamps on the radio itself becomes absolutely necessary, lest the signal be packed with artifacts. Unless you are working with noise cancellation in this way, an additional preamp is undesirable.

I think the main harm would be in the reception; overload is not likely to hurt the components in the radio (at least not in my experience).

...and this is a surprisingly good arrangement too.
On most HF bands, short of a beam antenna, this will
work about as good as anything - I have one similar to
this, and it either almost matches or outperforms my
DXUltra on nearly every band.

Yep, the first link is exactly what I experienced. Some loss across the board. Some improvement (looks like about 7dB) at certain (anti-resonant) spots. 7dB is slightly more than one S-unit.

From: christher69
Topic: 1664 Message: 1664

Hello folks,

Nice group nice radio and a lot of information here !

I am new to the group an I have been reading what people have to say
and I cant understand much of the AM-S debate honestly, but thats
me mostly a utility fan, as far as I am concerned I couldnt care less
if they took the AM button away completely, but thats not what I
wanted to say...

What I wanted to say was that ...

I found a trick on another R75 page that hasnt been mentioned in this
group so I wanted to post it .

It tricks the R75 to be able to receive in DSB aka both sidebands at
same time, havent tested it on ISB yet but will do it tonight, the
trick is to use filter setting 15 & 6 on SSB modes and thats about it.

I found the the trick here:

I WAS using the high impedance connector before, BUT I got noise from every thing, it seemed. Had to unplug computer, monitor, modem. It works MUCH better this way. I just hope no one turns me in for the violation. (looking up and down street through closed curtains ;)

1672. Utility Stuff

Yahoo group: icomr75 (2000 — 2002)
Date: 2002-05-24 23:58:44 UTC
From: christher69
Topic: 1672 Message: 1672

I had some lot of thinking before I bought this radio and its the best I have ever seen sofar, thats not much since my last receivers are ATS803 and Lowe HF150 which both were and still sort of are the best in their worlds, I am and will be a Utility fan and I have always tried to buy the best of value in that world, the HF150 is a great radio still if you fellows are so keen into AMS od S-AM, or even USD or USL as its splitted into different sidebands on the Lowe RIG, I havent got the slightest clue, but I think the Lowe is one hell of a BC radio listeners radio, BUT ! even agreed upon the fact that the AMS in this particular mode isnt working, I cant think of any real reason to ´bark on its features, I would like to know if there are any OTHER utility fans here to give some thougts of things like filter experiences in SSB modes FAX mnodes RTTY modes PSK modes remember outside the HAM world RTTY is not just 170hz or 450hz wide stuff, also FAX with its 1.9Khz reception CF and its special Filters that I havent seen for IF sofar as far as I remember, I dont want to be harsh but this whole groups messages has been more tban 80% about some BC station AM shit which this radio isnt designed for in the first place, so is there any thoughts and oddities mods etc for US that use this radio as its designed for in the first place ?

//Chris
Give me I can take it ...
If you think I cant punch me even harder I take that too...

hi Chris:

i decode utility via software using my computer's sound card. this requires no special filters... the stock 2.4 kHz ones allow being able to 'see' many signals at once using the software's waterfall or bandscope. i go over the software i use in the cookbook (see files section).

phil :)

Subject: [icomr75] R-75 Antenna

Anyway I was thinking of selling it when I came across the Broomstick Antenna while surfing. Being cheap I decided to alter it a little. I used 16 ga pvc covered wire I had a 500' spool in the shed. Instead of a round PVC pipe I used a 2" x 3" x 6' length of plywood I had under the porch. I wrapped the board from top to bottom with coils of wire running the start and end parts to the bottom and used black electrical tape to cover it. I connected the ends to a 6' length of RG-58 coax and soldered it then taped it also.

I estimated each turn of wire on the board was 3" x 3" x 2" for a total of 8" for each turn. There were 50 turns for every 6". So I had 400" of wire for every 6" of board. I had 12 sections of 50 turns so I had 4800" of wire top to bottom when figured out to 400 feet of 16 gauge wire coiled on this form. I can use the antenna tuner and tune throughout the band to match the antenna and peak the signal on the R-75 signal meter.

Wayne.

I use my r-75 to decode these utility signals using only the sound
card.
rtty sstv psk31 packet and other modes in the mix w software package
cw using cw get
hf weather fax/charts using wxsat
hf acars using pc-hfdl
aviation selcal using airnav selcal decoder
ale using pc-ale
I also use radio raft software for decoding various digital modes
usind a demodulator.
My r-75 is as supplied in the uk with no modifications.

Hi Just "Read the f$£$@£$ manual" ;-)

Well ...
I was extremely harsh since I wanted to have some reactions !!!

Perhaps its a wrong aproach, I am ofcourse not angry at this group or the effords of the so called "Rado" AMS thing, the AGC thing seems to be very very intresting, sorry that I make a first coldish introduction !!!
´

Yes I too like software like Mixw32 etc that is excelent as well as Radioraft is, though I am intrested of hearing of how other mil or utility users find the radios filters working: like the FAX decoding needs some filters etc. and SSTV and so on, I use personaly an external DSP for the AF afterwards "decoding" and the "RTTY" monitoring shows its best parts for me with this external thingy.

Though: I know there is IF filters ready for ICOM like 500,350,250 etc but I want to know the "reactions" and what people think about it , I have now ordered 1.9, and 1.8 Khz filters and I think it will be perhaps ok so so for Utility, but who knows, mayne the 1.9 would have been enough and instead using at the secondary IF stage (Read 3:rd) some 500 filter, this was my aggressive start, I wanted to get an oppinion, not to hurt anyone ofcourse, the fact is I am a very silent person ;-) !!!

PS:Anyone intrested in RR Comms
and if not check it out anyway...

1680. tk75 v0.3 software for IC-R75 now available

Yahoo group: icomr75 (2000 — 2002)
Date: 2002-05-27 13:31:54 UTC
From: Bob Parnass, AJ9S
Topic: 1680 Message: 1680

tk75 version 0.3 is now available for free download
from http://parnass.org

tk75 is open source, multiplatform software for controlling
and cloning the ICOM IC-R75 tabletop receiver.

Changes include:
New initialization logic obtains most of the Set Mode
settings by reading from the radio instead of using
defaults or using previously stored values.

Fixed bug in RF/Squelch knob Set Mode selection.

I use the free and more stable Linux operating system
instead of Windows. But, I wrote tk75 in Tcl/Tk so it runs on
either operating system.

It will probably run on Windows ME, Windows 2000,
Windows XP, MacOS X, Solaris, FreeBSD, and other environments,
but I've only tested it on Linux and Windows 98.

You can read about and download a beta test version of tk75
from my home page:

http://parnass.org (New web site)

I don't warrant the software, but it won't cost you anything.

Thanks to Bob Grove for the loan of an ICOM IC-R75 receiver
so I could design and test tk75.

Back when I started listening to SWBC stations in the 70's, there was a recommendation in a SWL book that said to try hooking a wire from the antenna jack of the radio to the finger stop of the telephone, you know, the old dial type? The book said sometimes it worked, sometimes it didn't. My parents had overhead telepone lines and it worked pretty well.

With most modern phone lines underground, it's much less likely to work nowadays and a piece of 22 AWG wire thrown over your roof will probably work better. You can even try 28-30 AWG black wire if you want really stealthy stuff.

1684. TK75 v 3

Yahoo group: icomr75 (2000 — 2002)
Date: 2002-05-28 05:17:41 UTC
From: jim_hack
Topic: 1684 Message: 1684

Just downloaded, installed, and ran this "new" program. I had never used any of the older versions, so I can't compare to them, BUT... This is MUCH better than Smart Icom Control32 which has lots of "lag" time between commands. Only (bug?) I saw was:
I manually (on radio) changed some of the filter settings, then went back to the program to find it was "hung". Apparently, it doesn't like you messing with the radio while it's in control:~)
I especially like the extra S. Fast AGC setting, as I performed Rado's AGC mod which makes the fast AGC about equal to the un-modded slow setting.
Kudos to Bob for his efforts.

Jim,

Glad you like tk75 software. Yes, tk75 will become confused if
you use the radio's front panel controls once the program
has started.

Thanks for the feedback.

Jim, you might not have known, but the "lag" time between commands can be tweaked in the Comms options. A default pacing value is used upon first startup to accommodate a wide range of host computers.

1691. TK75 v 3 vs Smart Icom32

Yahoo group: icomr75 (2000 — 2002)
Date: 2002-05-29 16:14:57 UTC
From: jim_hack
Topic: 1691 Message: 1691

I finally got a chance to play around with these a bit.
The ONLY improvements I personally would like to see in TK75 would be:
1) The ability to add to the PRESETS
2) The ability to write to individual memories (or did I just not see that?)
3) It would be nice to be able to drag the frequency indicator to a different position
4) Add a database like Smart Icom 32 has
Otherwise this is an excellent program for the price :~)

Smart Icom32...
Well, I lowered the pacing value as was suggested.
Now, when I start the program, it just hangs. (with or without the radio connected) I don't see any way to reset the value without removing and re-installing it. Maybe I'm just not savvy enough for this software.
I DO like the built in database. That is a definate plus.

Jim,

Thanks for your excellent suggestions for tk75.

Though tk75 ver 0.3 does not provide a GUI interface for changing
the Presets, you can customize them
by using an ASCII text editor (e.g., the
DOS edit program) to edit the "presets.tcl" file.

Important note: Be sure to make a backup copy of the file first.

Ew... that's not good. I'll have to see why that happened.

Just in case if anyone else has experienced this issue...
You don't need to re-install - just delete the smartcom.ini file and restart the program. It will go back to preset defaults on startup, or ask you for any new things that it needs.

Also, if the radio is set to communicate at a 19.2k serial rate you should need no more than a pacing value of about 30 or 40. If the radio is set to communicate at a slower serial rate, then you will need to up the pacing value accordingly. Rather than go into more detail on what the pacing values are here (or if anyone really cares), I do have a couple of sections in my FAQ page:
http://www.fineware-swl.com/faq.html#COMS

Hello everyone !

It's already been said that the IC-718 has a comparable performance with the IC-R75 as a receiver. My question is : is the ECSS method available/possible on the IC-718? I have not purchase any of the radio yet so there is no way for me to find out/experiment. I'm still undecided whether to buy the 718 or the R75 or both (",)

And is mounting/installing an internal ferrite bar antenna possible for both radio for AM/MW BC operations?

thanks...

Group,
MJF> Also, if the radio is set to communicate at a 19.2k serial rate
MJF> you should need no more than a pacing value of about 30 or 40.....
I have mine set at 20 at 19200 and it is just wonderful!
Runs well at 30 as well!
It's a great program, runs very well with absolutly no problems.
And Mark is VERY patient when it comes to product support :-)

Hello Simone,
Found on the home page for his software:

" FineWare has discontinued providing free and unlimited
support to unregistered users. The shareware license requires
that if you are evaluating a shareware version for longer than 60 days,
you must register to continue using it."

I had no problem with purchasing his program, It is well worth it. And
as low on the income ladder as I am, I didn't even have to go into debt
to do it. Besides, I don't know about you but I certainly don't work
for free. I suspect Mark's time is worth something as well.

Hmmm interesting idea, actually building a business by charging for
ones products and services.....we'll have to work on that.
I know, we can call it "Capitalism"!

It should be noted that the R75 is much more sensitive on the MW or
BCB band then the 718 is. This may be a deciding factor for you if your
primary interest is BCB/MW Dxing. As is the case most HF transceivers have
the BCB band intentionally attenuated. I own both of these radios and
believe me this does make quite a difference. Otherwise, the HF spectrums
are nearly identical in terms of sensitivity and selectviity.
Also, the NB on the R75 seems to be much more effective then the one in the
718.

I would not put a ferrite bar in the radio. I would instead get something like a Select-a-tenna with the wire terminals for MW DXing. The basic model inductively couples with a ferrite bar antenna with no physical connections. This wouldn't work with your 718/R-75, the next model up has terminals. Radio Shack sells something similar, but I don't recall whether it has terminal hook ups or not.

You could also build a MW loop antenna out of a cardboard box, a roll of magnet or wire-wrap wire and a variable capacitor salvaged from a junk radio. The performance is excellent, but the cosmetics is not as neat :)

1703. RE: [icomr75] Re: R75 Filter Setup

Yahoo group: icomr75 (2000 — 2002)
Date: 2002-06-01 19:23:18 UTC
From: Ed Pusey
Topic: 1562 Message: 1703

Friends:

I remember seeing some time ago some good advice on R-75 filter settings, but of course that was before I started paying attention. I am primarily an SSB & RTTY UTE listener. In addition to the standard FL-272 2.4 KHz filter, I also have installed FL-232 Narrow CW 350Hz and FL-52-A Narrow CW 455 KHz. My reading of the R-75 manual only confuses me. I know the mechanics of how to set the filters, but do not have a clue about which settings to select for W/M/N, nor which are the optimal settings for SSB, RTTY, etc.

I have also begun using Bob Parnass' Tk-75 software -- works great by the way, on my Windows ME -- which has made filter selections so much easier to confuse. The permutations and combinations short circuit a simple mind like mine.

Any recommendations or references? Thanks muchly!

Ed Pusey

Like the Select-A-Tenna Model # 541-M:
The Radio Shack AM Loop Antenna and
and the Terk AM Advantage Antenna both
have a connector for a direct wired output
to a receiver's high impedance inputs.
The SAT gives about 3-5 db more gain
across the AM BCB Band then the clones.

From: radiohighfreq
Topic: 1705 Message: 1705

Is anyone in this group using
any of these Commercial "AM"
Loop Antennas with the R75:

* Kiwa "Pocket" Loop ?

* Torus-Tuner Loop ?

* Quantum QX Loop ?

What are your Results and Opinions
on their AM Band Performance ?

~ RHF

HI RHF:I have the kiwa loop and a homebrew K9AY and in the past I tested the "Justice AM" ant[from ccrane.com]and I tested the Radio shack loop here my report:
1.The best indoor AM ant is the Kiwa loop[not the pocket]
2.The best outdoor and all AM ants is the K9AY [you can check it in www.aytechnologies.com no too expensive about $180.00.
3.The justice am ant [only $99.00]is very good and look very PRO.You can try one and ccrane give you 30 days money back warranty.
4.The RS loop work good and the price is fine.
5.I never see a quantum QX but some reports give this one, a near kiwa, performance.
Why Kiwa loop?Super sensitive and super null and selective performance.The K9AY is for Pro serious dixing but is an outdoor loop [You need about 30 feet yard].The Justice is the best for the price and the radio shack do a good work and is beatiful in any shack [remember it have 30 days money back too]Only my two cents I have a R-75 and this is my findings:Atagrasin

1710. R75 Executive

From: John M Gedde
Topic: 1710 Message: 1710

Just a heads up to you all. My R75 Executive softare is still progressing, but due to a malfunction in my R75, it has slowed greatly....

I have the required parts on order from Icom and Digikey to get it up and running again.

Regards,
John Gedde

1712. Rat Shack loop antenna

Yahoo group: icomr75 (2000 — 2002)
Date: 2002-06-04 03:37:34 UTC
From: jim_hack
Topic: 1712 Message: 1712

How do you use it with the 75?
I tried plugging in the leads from the loop's external jack to the ant and ground connections on my R75. It wouldn't pull in a thing on MW. It seems to make a big difference when inductively coupled to my DX-398 and YB-400. It also does absolutley nothing with my R-2, also.

1713. Re: Rat Shack loop antenna

Yahoo group: icomr75 (2000 — 2002)

Topic: 1712 Message: 1713

JH,

Of the three low priced AM Loop Antennas; the Radio Shack Loop Antenna (RSLA) is at the bottom, in the middle is the Terk, and at the Top is the Select-A-Tenna. All three are basically small 10" to 12" loop antennas.

The Output of the RSLA is 300 Onhms. So it should be hooked up to the two high impedance terminals of the R75. NOTE: Make sure that you have "ANT 2" Selected for Reception on the R75.

The RSLA should be placed 2-3 Feet away from the R75 and away from any metal objects. Place it on a Lazy Susan so it can be rotated for Signal Peaking and Null Checking or vice versa.

Here in OK-Land, Cali-4-Ni-A (SF Bay Area) With the RSLA Tuneing Knob set at mid range: All my major local AM Stations read S-9 to 10db; with the RSLA positioned N-S or E-W.

With the antenna feed line disconnected from the RSLA; but connected to the R75; reception was not possible. Basic Antenna Check: Is the Antenna working or is the 'Feed Line' working as an Antenna.

A 'Small" Loop Antenna does not produce a large signal output. But it does produce a low noise to signal ratio, that can be Peaked and Nulled.

Frequently Loop Antenna users will employ a Low Noise Pre-Amplifier to Boost the Loop's signal. The Advatage of using a Loop Antenna with the R75 is we have Two Pre-Amplifiers Built-In to our receivers.

From here in OK-Land, Cali-4-Ni-A
I used Three AM Dial Signal Check Points for the RSLA:

Low Point - 580 AM - KMJ
Fresno, CA ~ 160 Miles ~ South East

Mid Point - 1080 AM - KSCO
Santa Cruz, CA ~ 70 Miles ~ South

High Point - 1530 AM - KFBK
Sacramento, CA ~ 80 Miles ~ North East

Simply Positioning the RSLA and Tuning it for Peak Signal, produced a low S-1 to S-3 readable signal on average.

With Pre-Amp #1 switched in the signal level when to S-3 to S-5 on average and very readable.

With the second Pre-Amp #2 switched on the signal level then when to
S-6 to S-9 on average; with a clear copy.

Consider making a Larger 'Home Made' Loop Antenna they would gererally
produce greater signal levels: 2 Ft about 3-5 bd and 4 Ft about
6-10 db.

Suggest a double check of your set-up and a retry of thr RSLA.

~ RHF

Geez, I can pull in MW stations from MUCH farther away than the ones you mentioned with my 60ft random wire. I get stations from Arizonz, Wash, Oregon, Idaho, New Mexico, several from Nevada, and once pulled in a station from Texas. I DID have the R-75 on ant 2 when trying it out. May just be because I live in an aluminum mobile home. Although, like I stated previously, my yb400 and dx398 benefit from it's use. (inductively coupled) I'll play around with it some more and see if I cqan't get it to do SOMETHING on the R75.

True, but you have no way of nulling-out an interfering signal.

From: radiohighfreq
Topic: 1712 Message: 1716

* Njlar,
.
Yes, you are Correct: Peaking and Nulling are a key feature of using a loop antenna. The Radio Shack Loop at 10" is very small for use as a Stand-A-Lone loop antenna; but a good size for a portable radio 'coupling loop'. Naturally, a Larger 2'-4' homemade Loop would perform much better that Radio Shack, Terk and SAT as a Stand-A-Lone indoor loop antenna.
.
* Jim Hack,
.
The information I provided you was from my notes. What I did not identify was that these test were done "Mid-Day" using the Radio Shack AM Loop. Naturally an Out Side 60' Random Wire Antenna as you have reported would bring more distant stations. Plus, if you live in an aluminum mobile home, then any outside antenna would be far superior to an indoor antenna.
.
You may wish to consider the "Hula Hoop" Loop Antenna that is described on the Hard Core DX WebSite.
http://www.hard-core-dx.com/nordicdx/antenna/loop/hulaloop.html
Mounting it on a long pole out side and about 3'-4' above the roof and 3'-4' away from your moble home may prove to be an interesting home project and provide improved selective MW reception.
.

Samson,

I posted a similar request a few days concerning the FL-232 Narrow CW 350Hz and FL-52-A Narrow CW 455 KHz, but haven't received any feedback yet. I'm sure some of our more experienced users have the "answers," but just haven't sat down to figure out just what they are using themselves. If I get anything back, I'll make sure to share it with you. In the interim, I'm go to try what everyone else probably has had to do - pick a known freq and signal type and try multiple options/filter settings until I can figure out what the best ones are. Hope to hear from you again on this.

Yours,

Ed Pusey

1720. Re: r75 filters

Yahoo group: icomr75 (2000 — 2002)
Date: 2002-06-08 04:06:22 UTC
From: just_rtfm
Topic: 1717 Message: 1720

hello!

how about using these setups (9MHz and 455 kHz respectively)...

for Samson...

2.8 kHz and 6.0 kHz (ECSS)
2.4 kHz and 2.4 kHz (SSB)
2.4 kHz and 500 Hz (CW)

for Ed...
2.4 kHz and 2.4 kHz (SSB)
350 Hz and 500 Hz (CW)

2.4 kHz and 500 Hz (CW wide?) -OR-
15 kHz and 6.0 kHz (ECSS fine tuning)

i believe my cookbook in the files section goes over setting the
filters.

phil :)

1721. Ground Connection

Yahoo group: icomr75 (2000 — 2002)
Date: 2002-06-08 14:15:00 UTC
From: Bob Barr
Topic: 1721 Message: 1721

I just moved my R-75 to a new location. I don't have access to a cold water pipe or a ground rod. The only ground connection I am near is the ground on electrical outlets. My question is - how important is it to have the ground terminal on the radio connected to a ground? Is a wire connected to the outlet cover plate screw acceptable? I am sure others have this same situation and I am wondering what your experience is. Since my scanner doesn't have a ground terminal I wonder how necessary it is anyway? For reference, the power supply is plugged into a TrippLite Isobar surge and noise suppressor and my antenna is an attic mounted random wire fed thru a Palomar balun and coax to the radio.

Thanks for your help.

Regards,

Bob

1722. Scanning

Yahoo group: icomr75 (2000 — 2002)
Date: 2002-06-08 18:20:09 UTC
From: Moxie3
Topic: 1722 Message: 1722

Hi everyone! This is my first post so please bear with me. I just purchased my R75 and can't get the scanning to stop at any station. The scan resume mode is set to ON, and no matter which position the squelch knob is in, scanning never stops. The only way for me to stop scanning is to press the scan button or turn the squelch knob. Does anyone know what I'm not doing right? I searched the archives but I couldn't find a message with the same issues I have. Thanks,

I received my Free UT106 DSP today. The invoice was dated 18 March. I've installed it and it works great. For those still waiting on their DSP, hopefully ICOM now has enough on hand to fill all the back orders.

Is there any possibility European IC-R75 owners can join in getting a free DSP?
Maybe directly via Icom?

1731. Re: Ground Connection

Yahoo group: icomr75 (2000 — 2002)
Date: 2002-06-10 13:58:38 UTC
From: njlar
Topic: 1721 Message: 1731

Well, mine is not grounded either, BUT, my coax is grounded outside directly to an 8' ground rod with an inline surge suppressor, and the radio is connected to the coax through a grounding antenna switch which is left in the grounding (the antenna, not the radio) position when the radio is not in use. For good measure, I also disconnect the radio from the antenna switch when the weather is threatening or I'm gone for a while. I believe hooking the ground terminal to the ground rod would actually be counterproductive, because if the antenna did take a direct hit, since no ground is perfect, the radio would take a hit through the ground connection, vs now it's usually totally isolated from the outside world duriing a thunderstorm. But this is theory - I haven't had an actual experience.

I was informed by an experienced DXer and ICOM that a ground is necessary even though the antenna is in the attic. The DXer also stated that the ground also improves reception. My antenna is connected to the spring loaded connection as is my ground wire. When I'm not using the unit, I disconnect the antenna wire but not the ground - I guess I could disconnect both but I don't see an advantage of do so. I also unplug the power when the unit is not in use even though it is connected to a surge protector.

1733. Unplug AC Adapter When Not In Use?

Does anyone know whether you should unplug the AC adapter when the unit is not in use? I ask because the Sony I had recommended that the AC adapter be unplugged when the radio is not being used. There isn't a recommendation to unplug it in the ICOM manual.

Hiya

Have to agree with Ed - Can European owners get a DSP for free - and whats the criteria ?, I'm guessing my 2 yr old 75 won't be elligible

A ground is definitely an essential part of an antenna system. Your antenna, wherever it may be sited, picks up stray signals (interference). Your receiver has filters which send this interference to ground/the chassis of the receiver. If you have no ground connected, the interference stays in the receiver.

But a ground is not any part of an AC wall socket! Nor is it a flimsy wire to an earth spike 5m away.

Ground wires must be substantial and offer a good surface area (RF travels on the surface of a conductor) which is why the proper type is wide copper strap (50mm or 100mm upwards if around transmitters)

Ground wires must travel the shortest distance possible, offer the biggest surface area, be the best conductor and end in an earth spike which offers the biggest surface area, is a good conductor and has a good connection between the two (preferable soldered). The spike must be in ground offering good conductivity. if not.water the area every few days.

Simplified, but close enough to the ideal.

I have the following to trade for a late, MINT Icom R75 w/DSP unit:

Like new Uniden Bearcat 3000XLT w/telescoping antenna and case,
barely used.
Sony 7600G VG cond.
Sony AN-LP1 purchased new recently

Would also throw in a Sony 7600GR w/Sony PS in excellent cond. if
you have an R75 with all the Kiwa mods. No scratched items please.

Correction, the Bearcat is a UBC 3000XLT, the unblocked version w/ps.

Todd, thanks for the info. I have 2 questions: 1.) What gauge wire do you recommend attaching to the spring loaded connection? 2.) If lightning strikes at or near a ground rod, can the voltage follow the ground wire to the receiver and damage it or would the voltage dissipate into the ground?

Subject: Re: [icomr75] Re: Ground Connection

A ground is definitely an essential part of an antenna system. Your antenna, wherever it may be sited, picks up stray signals (interference). Your receiver has filters which send this interference to ground/the chassis of the receiver. If you have no ground connected, the interference stays in the receiver.

But a ground is not any part of an AC wall socket! Nor is it a flimsy wire to an earth spike 5m away.

Ground wires must be substantial and offer a good surface area (RF travels on the surface of a conductor) which is why the proper type is wide copper strap (50mm or 100mm upwards if around transmitters)

Ground wires must travel the shortest distance possible, offer the biggest surface area, be the best conductor and end in an earth spike which offers the biggest surface area, is a good conductor and has a good connection between the two (preferable soldered). The spike must be in ground offering good conductivity. if not.water the area every few days.

Simplified, but close enough to the ideal.

I was informed by an experienced DXer and ICOM that a ground is
necessary even though the antenna is in the attic. The DXer also
stated that the ground also improves reception. My antenna is
connected to the spring loaded connection as is my ground wire. When
I'm not using the unit, I disconnect the antenna wire but not the
ground - I guess I could disconnect both but I don't see an advantage
of do so. I also unplug the power when the unit is not in use even
though it is connected to a surge protector.

My new receiver has 2 large screw holes on each side (right & left side). I'm wondering whether these holes are supposed to have screws in them as the cabinet appears unfinished without the screws. Do all these units come without the screws?

George

Answers -

1) use as big a cable as you find practical. I'd recommend 50-100mm copper earthing strap (ugly and hard to work with, but the best) run to a point near the radio and then a short flexible lead to the Ant 2 earth. For the short lead, also use something substantial like braiding (shielding) off some co-ax. The more surface area the better.

2) I have no idea. I'd like to think the earth would do the job, but my gut tells me your radio might get fried too.

Todd

(PS - I'm no expert)

From: njlar
Topic: 1721 Message: 1743

What I've read is that NOTHING can withstand a direct lightning hit. But nearby hits (say a tree 100 feet away) can also damage your radio unless you ground it and put in a surge protector. Also, things that are grounded are less likely to be hit in the first place because the charge in the air is dissipated before it can build up high enough to ionize the air which is necessary before an actual strike can take place. That's why you should ground your antenna when not in use.

I think those are holes for mounting a carrying handle or a mobile mount.
Mine came without any screws filling them in.

Exactly. This is why lightning rods work - they do not attract lightning,
but rather dissipate the electrical energy efficiently before lightning
can strike.

From: HFSSB
Topic: 1721 Message: 1746

Recent research has shown that the released potential formed before a lighting strike often goes from the ground up!

From http://thunder.msfc.nasa.gov/primer/primer2.html
"DESCRIPTION OF LIGHTNING DISCHARGE PROCESSES - With the initial breakdown of the air in a region of strong electric fields, a streamer may begin to propagate downward toward the Earth. It moves in discrete steps of about 50 meters each and is called a stepped leader. As it grows, it creates an ionized path depositing charge along the channel, and as the stepped leader nears the Earth, a large potential difference is generated between the end of the leader and the Earth. Typically, a streamer is launched from the Earth and intercepts the descending stepped leader just before it reaches the ground. Once a connecting path is achieved, a return stroke flies up the already ionized path at close to the speed of light. This return stroke releases tremendous energy, bright light and thunder. Occasionally, where a thunderstorm grows over a tall Earth grounded object, such as a radio antenna, an upward leader may propagate from the object toward the cloud. This "ground-to-cloud" flash generally transfers a net positive charge to Earth and is characterized by upward pointing branches. "

Hams out here in the SE USA where the cold and warm air masses often meet, have learned to disconnect BOTH ant and ground during a lighting storm. In fact, many Ham's do not use grounds at all! This only works if you have no RFI problems (usually only a problem during transmitting), it is still recommended to ground the ant. system.

This is gonna start a flamewar, but...

...both assertions are incorrect. It not only is possible to protect
equipment against lightning strikes, it is done all the time at TV and
radio stations. Likewise, lightning rods do get hit. All the time.
Ask anyone with an old barn.

There are a lot of myths about lightning that should be debunked,
but because lightning behaves in an *apparantly* random way, the
myths persist. To protect your gear you need a complete lightning
protection system, encompassing all aspects of your gear. Anything
that bypasses your system, such as an extension cord, computer cable
or phone line, nullifies the whole system.

The best place to get building blocks for your system (suppressors, etc)
is Polyphaser. I use 'em, and they are truly incredibly high quality
devices.

www.polyphaser.com

They also publish a book called "The 'Grounds' for lightning and EMP
protection" which lays out how it is done. ICE engineering also has
products that are in the same quality range as PolyPhaser.

The most knowledgeable person on the 'net is a broadcast and lightning
and safety engineer named Gary Coffman. Use Google to search usenet
for all his postings on rec.radio.amateur.* -- worth reading.

Many web pages have collected his postings and you can use Google to find them as well.

The below excerpt is from the following page; more details can be found at the actual page:

http://www.harvardrepeater.org/news/lightning.html

(begin quote)

I assert, from personal and broadcast experience spanning 30 years, that you can design a system that will handle *direct lightning strikes* on a routine basis. It takes some planning and careful layout, but it's not hard, nor is it overly expensive. At WXIA-TV, my other job, we take direct lightning strikes nearly every time there's a thunderstorm. Our downtime from such strikes is almost non-existant. The last time we went down from a strike, it was due to a strike on the power company's lines knocking *them* out, and our local generator picked up the load 12 seconds later.

I have a 440 MHz repeater located at the 970 foot level of that tower, and it has suffered no lightning damage in 4 years of operation, though there are burn marks on the repeater antenna from direct strikes. As in the shoemaker's case where his own children are barefoot, I took $10,000 worth of damage to my home station from a direct hit 3 years ago. That was because I didn't practice what I *knew* were effective lightning protective methods. After redoing the station following the hit, I've taken at least two more direct strikes, maybe more since I'm not home for every storm. There was *no* damage from the first, and the second got a Radio Shack UHF preamp mounted on my UHF TV antenna, but *not* the TV in the house thanks to proper protection. I could have protected the preamp too, but it wasn't worth the effort. A new one is cheaper than the protective measures required.

Since my disasterous strike, I've been campaigning vigorously to educate amateurs that you *can* avoid damage from direct strikes. The belief that there's no protection from direct strike damage is *myth*. It's equally myth that a blitz bug and a piece of #12 wire will protect you from nearby strikes. In fact, if you install supressors *slightly* wrong, they can be worse than no protective measures at all. Let me repeat that since it's vitally important, incorrectly installed suppressors can be worse than no suppressors at all. The instructions that come with suppressors, if any, are woefully incomplete and misleading. Ask an expert, or even better, become an expert on the subject.

The keys to effective lightning protection are surprisingly simple, and surprisingly less than obvious. Of course you *must* have a single point ground system that eliminates all ground loops. And you must present a low *impedance* path for the energy to go. That's most generally a low *inductance* path rather than just a low ohm DC path. Lightning energy is RF, and incredible voltages can build up across very small inductors when we're dealing with thousands of amps of surge current. The surge is very brief, so huge bussbars aren't needed, but the protective conductors must be low impedance at the frequencies of interest.

Addendum:
You might say that antennas are designed from the ground up, literally. Good antenna design incorporates the ground as part of the antenna. A ground also allows a path for stray RF, but lightning protection... forget it. If you must have a continuous ground as in a broadcast station setup, than you better have the best grounding system possible but for us ordinary SWL/Ham folks the best lightning protection is to disconnect everything, power supply, ant. AND ground during a storm. When you hear thunder getting near, it's time to disconnect. As you can see from the discussion below, a ground gives built up "potential charges" a direct path to your equipment!

Marty

-----Original Message-----

Recent research has shown that the released potential formed before a lighting strike often goes from the ground up!

From http://thunder.msfc.nasa.gov/primer/primer2.html
"DESCRIPTION OF LIGHTNING DISCHARGE PROCESSES - With the initial breakdown of the air in a region of strong electric fields, a streamer may begin to propagate downward toward the Earth. It moves in discrete steps of about 50 meters each and is called a stepped leader. As it grows, it creates an ionized path depositing charge along the channel, and as the stepped leader nears the Earth, a large potential difference is generated between the end of the leader and the Earth. Typically, a streamer is launched from the Earth and intercepts the descending stepped leader just before it reaches the ground. Once a connecting path is achieved, a return stroke flies up the already ionized path at close to the speed of light. This return stroke releases tremendous energy, bright light and thunder. Occasionally, where a thunderstorm grows over a tall Earth grounded object, such as a radio antenna, an upward leader may propagate from the object toward the cloud. This "ground-to-cloud" flash generally transfers a net positive charge to Earth and is characterized by upward pointing branches. "

Hams out here in the SE USA where the cold and warm air masses often meet, have learned to disconnect BOTH ant and ground during a lighting storm. In fact, many Ham's do not use grounds at all! This only works if you have no RFI problems (usually only a problem during transmitting), it is still recommended to ground the ant. system.

Since our receivers receive from .03 to 60 MHz, has anyone received voice in the LF range (.03 - .3 MHz) and the MF range (.3 - 3.0) other than local am radio stations? What about anything above 30 MHz?

Interesting Topic,
I would venture to say that three conditions exist.

1. Day to Day 'Protection' of the Receiver from Static Build-Up and EMF Discharges. First, Disconnect the Antenna when the receiver is not in use. HOW? Project "APC" Built an "Inline Antenna Protection Circuit" for the antenna ground system. WHAT? A Box with the following items in it. Starting at the Antenna Ground End: First, a 100K Ohm High-Z Bleed Resistor between Antenna and Ground; would help in bleeding off antenna static build-up. Then, a single Neon Bulb placed across the antenna and ground; would help to discharge any EMF Pulses picked up by the antenna. Followed by a 10 Ohm Dropping Resistor in the antenna and ground legs. Next, Two Sets of series connected 1N914 Diodes, these pairs are connected front-to-back; to limited signal input levels. Finally a DPDT switch on the receiver end, wired to connect the receiver to the antenna in one position and the other position disconnects the antenna from the receiver and shunts the antenna to ground. The advantage of this little box is: When the antenna is switched on to the receiver: the receiver is triple protected. When the antenna is disconnected from the receiver, the antenna is shunted to ground through the boxes internal circuit and static does not build-up on the antenna. Connecting a Free Floating Antenna (non grounded) that has 'built-up' a static charge to a modern solid state receiver can be a major Oops!

2. During a Thunder and Lightening Storm in your local area. Completely disconnecting the receiver from antenna and ground: Physically remove the connections. Unplugging the power input to the receiver, at the receiver. This effectively "Isolates" the receiver from all electrical connections and ground. Project "RFS" Build an RF Input 'Shorting Bar'. A 'Shorting Bar' can simply be made of a 3" piece of Bare Solid Copper Wire 16~18AWG bent to fit into and across the High-Z Terminals. Add a piece of 4" Insulated Stranded Copper Wired 16~18AWG and Strip both ends 3/4". Solder one end of the stranded wire to the center of the "Shorting Bar" and install a Banana Plug on the other end. How to Use It? Insert the 'Shorting Bar' into the two High Impedance Terminals and Banana Plug into the SO-239's center connector. This effectively 'Shunts' the RF Inputs of the receiver.

3. Direct Lightening Hit - Pray for Your Family and Self, Your Home and oh yes... the receiver.

Yes, this is an issue, especially with end-fed wires -- random wires,
Beverages, longwires.

> First, Disconnect the Antenna when the receiver is not
>in use.

Well, yes, your receiver is safest in a Tempest box, then a Faraday cage,
then with shorting connectors on all inputs and outputs, but NOT just
disconnected. Why? You still can get differential currents across the
connectors if you get a direct strike.

> HOW? Project "APC" Built an "Inline Antenna Protection

Always a good idea, but sometimes not necessary, for example if you have
an impedence matching transformer in your line, it will be a good static
drain. Furthermore, ICOM puts bleeder resisters across its antenna inputs.

> Then, a single Neon Bulb
>placed across the antenna and ground; would help to discharge any EMF
>Pulses picked up by the antenna.

A better choice is to use an actual gas-discharge tube. The only difference
is the energy handling capacity. The leads are heavier and the case is
ceramic, not glass. A near strike can vaporize the leads of that neon tube
but leave the gas-discharge tube alone.

Find a surplus house in your area. You *won't* find these at Rat Shack,
but I can get them by the handful for $0.50 each locally. Siemens is
usually the brand on them. These are the same tubes you find in MFJ and
Alpha-delta supressors, as well as ICE products.

> Followed by a 10 Ohm Dropping
>Resistor in the antenna and ground legs.

BAD, BAD idea. Keep your receiver at ground potential, always. If your receiver floats above ground, you walking around in low humidity can kill it by touching it. A better idea (for receive only) is to use a grain-of-wheat lamp in the center conductor. Or a 5kv, 0.01uF capacitor. (Higher capacitance if you like VLF, but 0.1uF is max needed.)

> Next, Two Sets of series
>connected 1N914 Diodes, these pairs are connected front-to-back; to
>limited signal input levels.

A caution on this. If you are driving that antenna with high signal levels, these WILL generate harmonics all over the place by mixing all the signals coming in. So if you are near a broadcast antenna, you may not want this. You can get around this by wiring your 4 diodes in series-parallel, like this,

```
+-->|-->|--+
+--|<--|<--+
```

Or using diodes with large drop voltages, or using zener diodes. I'm thinking about trying Transorbs as well to see how they do, but I don't know how they behave at RF.

> Finally a DPDT switch on the receiver
>end, wired to connect the receiver to the antenna in one position and
>the other position disconnects the antenna from the receiver and

Not very effective against a direct strike. The inductances and loss across the contacts will result in a voltage differential of tens of thousands of volts. The switch would be sacrificial if it helps.

> The advantage of this little box is:
>When the antenna is switched on to the receiver: the receiver is

On that we agree. I can run a string of 20 neon lamps off a 140 foot wire here in CO when clouds are overhead.

This in fact would be highly effective, but no less effective than gas-tubes
while connected to the antenna.

>3. Direct Lightening Hit - Pray for Your Family and Self, Your Home
>and oh yes... the receiver.

This is where we differ the most.

If you are worried about a direct hit on your house, get lightning rods
installed properly. DO NOT get those anti-lightning brushes. They don't
work. Along that same line, believe it or not, a rounded tip on the
lightning rod is more effective than a sharp one.

If you are worried about a strike on your antenna and its ramifications
for your home, use a good lightning protection system. The system will
consist of a ground window (where every conductor going to and from your
radio gear will go through a quality supressor), a ground system, the
supressors, and the conductors to tie the grounds together. If you buy
suppressors, use Polyphaser or ICE. If you want to build your own, you
can use inductors and MOVs for phone lines and power lines, and Siemens
gas tubes and high-voltage capacitors for the antenna. The cap goes in
series with the center conductor, the gas tube goes between the antenna
side of the capacitor and the coax-shield, which must be grounded.

All supressors must be mounted on the ground window.

The conductors to the grounding system should be flat copper strap, not
braid. Surface area is what counts, so a relatively small strap is more
effective than a large solid wire. The important thing is that they be
as short as possible without introducing any sharp bends; you need a
low impedence (low resistance AND low inductance) ground. At a lightning
strike's rise time, current and voltage, a tall rack acts like an inductor
sufficient to have several thousand volts differential between top and
bottom.

And differential currents are what you are most concerned about. If you
get a direct strike you *will* have your equipment be 10s of thousands
of volts above ground potential but if it all rises and falls at the same
time at that potential, there's no problem.

The final part of your system, the ground system, is most misunderstood.
One ground rod doesn't cut it. You usually want a ground system consisting
of multiple 8 ft. rods spaced at least 16 ft. apart, radiating out from the
point where you tie into the system, all interconnected by strap.

Well now, just suppose, by some bizarre theory, that you can't afford to do
all this, or that you find it to be overkill. Not that anyone would find
that to be true, of course... :-)

Where to start: Make a ground window. Tie your supressors to it. ALL lines that go to your station equipment must go through these supressors. One extension cord or data cable that doesn't defeats everything.

If you can't buy supressors, build them as I described above with the gas tube and the high voltage cap for the antenna lines, MOVs for everything else. Open a high quality suppressor like APC or Panamax to see how they do it, then do the same thing on your ground windor, or mount a metal-cased one to your ground window. (The ground window is a sheet of steel or copper.)

Then get conductors to your ground rod.

Then add ground rods.

If you are using an antenna (like an end-fed wire) that works against ground and needs a matching transformer, put a gas tube across it there.

You *can* do it, one piece at a time, and get there safely.

Just DON'T bypass a suppressor for one cable. You'll regret it.

DON'T let your receiver float above ground.

Some cheap suppressors by big-name manufacturers connect a gas tube to the center conductor of a coax but don't connect to ground. DON'T USE THEM! They actually INCREASE the risk for your equipment, since the lightning pulse travels at different speeds through the center conductor and the shield of a coax, you will clamp down on one and let the other pass, creating a bigger differential current.

DON'T use solder -- it will explode into vapor (just like water) when a strike occurs, blowing your connection apart. (In the ground system, I mean.)

Sharp bends in your ground lines are inductors. Inductors are a bad thing in your ground system...

This is a pic of a rack full of antique and irreplaceable (to me) equipment. The ground window is at the top. Note the strap mounting brackets, and that no strap is mounted in them. (Bad me -- no donut!) That was addressed and fixed.

This is at table mountain, north of Boulder, CO, in the control room for a 60 foot diameter dish that stands a good 150 feet up, and is the highest object in about a 3 mile radius. Think we never get hit????

A good choice of diode according to Tom, W8JI, is 1N4007, because they
don't start conducting until about 0.7 volt.

In order of priority:

Gas tube across the clips.

Series-parallel diodes, 1N4007s, as described in my post.

100kohm resister across the clips.

High-voltage capacitor on the "red" clip between all the junk above on
the antenna side, and your radio.

```
-----+++---||---- (red on ICOM)
|||
v-\
-^/
Ant ||\
v-/
-^\
|||
-----+++--------- (black on ICOM)
```

(Hope you can follow the ASCII art. Use a monospace font to view.)

Don't worry about your antenna "attracting" lightning; that doesn't
happen, and if your antenna takes a direct hit, in the attic, you have
bigger worries than the ICOM. This will do for that situation.

I've never lost a piece of radio gear to lightning since doing all this
stuff. Before, yes. Now, nope.

Eric,

Unfortunately, I'm very new at this stuff and have no clue about gas tubes, diodes, ohms, etc. Is there something that can be purchased which will have the same effect as what you described in your post?

Secondly, I live in Florida, known for daily lightning storms this time of year. Consequently, I will be disconnecting the power and the 2 wires (ground & antenna)going to the spring loaded connectors on the back of the receiver. Connecting these 2 wires and disconnecting them several times each day has become a hassle. Would you recommend some type of connector to join both wires like a 259 connector (I think that's the antenna connector number which goes to the receiver) so that it would be easier to connect & disconnect?

George

George,

We all have to start somewhere, and "I don't know" is one of the most
intelligent things a person can say.

Unfortunately, from my experience, the people who build this type of
equipment target people using the coaxial (round) cables, rather than
the high-impedence connectors that you are using.

Now you *can* put a matching transformer with built-in protection
in place and just connect it to the low-impedence connector.

If you want to go that route...

Buy an ICE 180A. You can get them from cable-x-perts (www.cablexperts.com)
or eham.net, among other places. Do a google search to find vendors.

If you are into self-punishment, buy the ICE 182A from eham.net, like
I just did. It works well into VLF range, and costs the same as the
180A, but they are built on an order-by-order basis, and it can take a
while.

You would connect the ICE 180A to the ICOM by coaxial cable. A
PL259 to PL259 jumper cable would be what you'd use. The '180A
is a small aluminum box; you might want to set it on the floor.
A 6 ft. cable would be fine. You can also get that from
cable-x-perts; if you do that, get RG-8X, it is a very flexible
cable. The part number for their 6 ft jumper is CXP08XCB6.
(Go to www.cablexperts.com, click on "RF Cable Assemblies", click
on "Ready made coax cables (HF) and HT solutions")

Then you would set your ICOM to use Antenna 1 and tie everything
together. The coax and ICE would connect to the SO239 jack on the
back of the radio, the antenna would connect to one of the screws
on the ICE, the cable would connect the two. The ground screw
connects to ground, preferably the ground your surge suppressor
for the ICOM power supply is plugged into. This is pretty foolproof.

You would not need to disconnect your radio with this setup.

...
The other approach is to build. Here's where you get to play
easter-egg hunt. You also have to be willing to solder. I
actually wrote up part of what you needed to do and decided
it wasn't worth it in time or effort, so I suggest you do the
above, and then build a suppressor, after you are up on the
air, if you want to.

If you want to take the leap, say so, and I'll walk you through.

> Secondly, I live in Florida, known for daily lightning storms this
> time of year. Consequently, I will be disconnecting the power and
> the 2 wires (ground & antenna)going to the spring loaded connectors
> on the back of the receiver. Connecting these 2 wires and
> disconnecting them several times each day has become a hassle.
> Would you recommend some type of connector to join both wires
> like a 259 connector (I think that's the antenna connector number
> which goes to the receiver) so that it would be easier to connect
> & disconnect?

If you buy the ICE, you won't be using these connectors any more.
However, the thing to do is to use pin connectors designed for older
test meters. They used to come in pairs, spaced at the right spacing
for the two connectors, and you could just use the screws on the
connectors to tie your wires to them. The signle-pin connectors
which you can still find require soldering. You can still find
the double-connectors with "banana plugs" on them but they won't
fit.

BTW, I used to live in FL and now live on the CO front range, which
is second only to FL in lightning. I think it is worse here, though,
because the dry air makes static a major problem.

In my other posting, I mentioned Table Mtn and the fact that we
are the highest object around... any time a cloud passes overhead,
we get St. Elmo's Fire playing about all tall or sharp objects
around. Telephone poles, the dish itself, ham radio antennas.

>
> George

Good luck, and let me know what you decide to do!

Eric

From: Moxie3
Topic: 1721 Message: 1758

Eric,

Thanks for the in-depth information. Once I digest everything, I'll decide on one of your recommendations. If you don't mind, a few more basic questions:

1.) Are the high impedance connectors you referred to the spring loaded connectors on the back of the receiver, and the low impedance connector the PL239 on the receiver?

2.) What is a "matching transformer"? I think of a transformer as an electrical device as used with electric trains or by electricity companies.

3.) Is the ICE 180 & 182 a static suppressor?

4.) You mentioned that the ICE182 works well into the VLF range; I wouldn't think that a static suppressor, if it is one, would affect the radio's receipt of signals.

5.) Lastly, you mentioned that the "ground screw connects to ground, preferably the ground the surge protector that the Icom power supply is plugged into" - is the "ground screw" your referring to on the ICE? Also, my surge protector doesn't have a ground connection, it's an Isobar surge protector. This is what I plug the Icom power supply to. My present ground is to a cold water pipe.

Regards,
George

P.S. How long have you lived in Florida and Colorado?

> connector the PL239 on the receiver?

Yes. The spring connectors have an impedence of 450 to 600 ohms and
the PL259 has an impedence of 50 ohms. Impedence is what you might
call an "apparant resistance" to the flow of electric current, made up
of true resistance, capacitive and inductive reactance. Eventually
you'll learn what all te words mean. I promise! :-)

>
> 2.) What is a "matching transformer"? I think of a transformer as
> an electrical device as used with electric trains or by
> electricity companies.

It is very similar, except in this case we're talking about a transformer
that works with radio frequency signals as well. Another, more technical
definition of impedance is voltage divided by current. An end-fed wire
usually presents a high impedance to whatever it is connected with. You
can connect it to a low-impedance feed, but a lot of the energy received
by antenna will be lost. The matching transformers' purpose is to maximize
energy transfer. Now it won't provide an exact match in this case, but
it will provide a better match.

Note that you use matching transformers in other places. Tube-based
audio equipment uses them to connect speakers to the amps. A TV may
use them to match a 300 ohm antenna to the 75 ohm connection.

>
> 3.) Is the ICE 180 & 182 a static suppressor?
>

The two ICE products are combination matching transformer, static
supressor and DC block.

I know of no manufacturer that specializes in suppressors for high
impedence (like the spring clip) connections. Here we're using a
product that does 3 things because 2 of them we want, and the third
is a side effect that does no harm and may be useful later.

> 4.) You mentioned that the ICE182 works well into the VLF range;
> I wouldn't think that a static suppressor, if it is one, would affect
> the radio's receipt of signals.

It wouldn't. But the ICE also contains a transformer, which can have a limited usable range. But in the ICE, I think the only difference is the DC blocking capacitor, which is larger in the '182. I *believe* the transformers are identical, but they, too, could be different.
>
> 5.) Lastly, you mentioned that the "ground screw connects to ground, > preferably the ground the surge protector that the Icom power supply > is plugged into" - is the "ground screw" your referring to on the ICE?

Yes. It has a ground screw on the side.

I may be overcomplicating things here... There are 3 types of ground you should be thinking in terms of. One is a safety ground. That's the third prong on your outlet, that ties to a ground rod at your breaker box. Another is the RF ground, your cold water pipe. The third is a lightning ground, which is what I described before.

Since a direct strike is unlikely, and has far more damaging effects than the loss of an ICOM, but a nearby strike is likely, we can use either the RF or safety ground as the "lightning" ground in this case. If your antenna were on a tall tower or on tall trees in the back yard, we couldn't make that assumption.

Now I think in this case you should leave the grounds alone becaus it can get complicated. Your safety ground and RF ground can continue to serve as they do.

> Also, my surge protector doesn't have a ground connection, it's an > Isobar surge protector. This is what I plug the Icom power supply to. > My present ground is to a cold water pipe.

That third prong is its ground connection, and for my radios, I have the house safety ground tied to the RF ground at that point. That's the ground window for my equipment. There's a variety of reasons not to do that with your system, for this one I'll spare you the details. :-)

Some more ideas for you to chew on... The ICE transformer is designed to feed a wire antenna some distance from your receiver. Let's say your antenna is in the back yard. What you could do is run coaxial cable from your ICOM to the ICE transformer all the way in the back yard, then connect the antenna there. Your lightning and RF ground would also be there, and you would bolt the ICE transformer to the ground rod. You could also connect a ground wire to the ICOM to a wall-outlet screw as a safety ground.

What this would do is two-fold: 1) it gets the "hazardous" parts of your antenna system away from the house and 2) since the coax, grounded at the ICE box end, won't pick up any RF, any electrical noise from your house is minimized.

Now in your case, the antenna is in the attic. So you could mount the ICE box on the cold water pipe with a couple U bolts (kit also available from ICE, or just go to the hardware store), and run the antenna lead from there up into the attic, or you could put the ICE box in the attic and run the

ground wire down from there. I would do the former, but the systems aren't that electrically different. In any case, local noise pickup, from, say, your computer would be minimized. -- the effective part of the antenna is the wire, not the coaxial cable.

Just another thought... maybe something to do at a later date.

> Regards,
> George

Eric

> P.S. How long have you lived in Florida and Colorado?
>

I lived in Fort Walton Beach from 1990-1993, and have been in Colorado since 1993. Most of that time in Boulder, CO, but currently in Loveland, CO.

> My present ground is to a cold water pipe.

That third prong is its ground connection, and for my radios, I have the house safety ground tied to the RF ground at that point. That's the ground window for my equipment. There's a variety of reasons not to do that with your system, for this one I'll spare you the details. :-)

Some more ideas for you to chew on... The ICE transformer is designed to feed a wire antenna some distance from your receiver. Let's say your antenna is in the back yard. What you could do is run coaxial cable from your ICOM to the ICE transformer all the way in the back yard, then connect the antenna there. Your lightning and RF ground would also be there, and you would bolt the ICE transformer to the ground rod. You could also connect a ground wire to the ICOM to a wall-outlet screw as a safety ground.

What this would do is two-fold: 1) it gets the "hazardous" parts of your antenna system away from the house and 2) since the coax, grounded at the ICE box end, won't pick up any RF, any electrical noise from your house is minimized.

Now in your case, the antenna is in the attic. So you could mount the ICE box on the cold water pipe with a couple U bolts (kit also available from ICE, or just go to the hardware store), and run the antenna lead from there up into the attic, or you could put the ICE box in the attic and run the ground wire down from there. I would do the former, but the systems aren't that electrically different. In any case, local noise pickup, from, say, your computer would be minimized. -- the effective part of the antenna is the wire, not the coaxial cable.

Just another thought... maybe something to do at a later date.

> Regards,
> George

Eric

> P.S. How long have you lived in Florida and Colorado?
>

I lived in Fort Walton Beach from 1990-1993, and have been in Colorado since 1993. Most of that time in Boulder, CO, but currently in Loveland, CO.

1766. new r-75 with NB problem

Yahoo group: icomr75 (2000 — 2002)
Date: 2002-06-14 03:08:40 UTC
From: HFSSB
Topic: 1721 Message: 1766

I just received a used R75 w/DSP, honey of a receiver but one complaint, the NB does zilch. I have experience with many radios over many years (more than I want to think about) so I do know what a noise blanker does. Does the DSP disable the NB or is there a known fix for this problem?
Thanks for any help.

Marty KT4K

1767. Re: [icomr75] new r-75 with NB problem

Yahoo group: icomr75 (2000 — 2002)

From: Gert Nilsson
Topic: 1721 Message: 1767

Does the DSP
disable the NB or is there a known fix for this problem?

The DSP does not disable the NB. The noise blanker is very good in eliminating pulse noise from ignitions, thunder and similar. Some distortion may be heard if it is used when there are strong signals within aprox 10 kHz. This type of noiseblanker is like a gate closing for the time of the pulse. This is the reason why it is not effective against the kind of background noise heard in the background most of the time. The R75 DSP NR has some effect eliminating this kind of noise. It is not extremely effective, I have a MFJ 784 and in a comparison the NR is better on the 784, but the ANF is better on the R75 DSP.

From: radiohighfreq
Topic: 1721 Message: 1768

EFR,

Read your reply and the other follow-ups twice.

My next generation "APC" Box will incorporate some of your
recommendations:

Gas-Discharge Tube -v- Neon Bulb

0.01uF Capacitor 5KV -v- 10 Ohm Resistor

Four 1N4007 Diodes -v- 1N914s
A-->|-->|--G
A--|<--|<--G

Fortunately here in OK-Land, Cali-4-Ni-A
Thunder & Lightning are on average a distant once a year event.

~ RHF

Thanks to all who replied. Funny thing, I moved the radio to another room and connected a different ant. I also played with the filter menu and now the NB is working like it should! Maybe operator error or changing the filter settings? Anyhow, it's working now and I'm quite impressed with this little receiver. Thanks again, Marty

-----Original Message-----

Sounds good -- but don't take me for an expert. I'm just parroting what
others have said, and like I said before, the intuitively obvious is often
wrong. I have really come to trust Polyphaser's publications on lightning
because they apply beyond their own product line. Likewise, when pushed
to provide hard evidence and/or theory backing up what he says, Gary
Coffman never has failed to deliver. And since one of his companies
is "Destructive Testing Systems -- you make it, we break it. Guaranteed!"
I appreciate his expertise on how to make things *survive.* He really
is an expert.

> Fortunately here in OK-Land, Cali-4-Ni-A

I know, but it causes mass panic, rioting and people to drive the
wrong way on the L.A. freeways. I know 'cuz I see it in the movies
all the time! :-)

Phil, I know this is an old subject but I'm very confused. Upon my purchase of the receiver I found that when in scanning mode, it did not stop on stations. You recommended turning the RF/SQ knob just past twelve o'clock. Thanks to you, it worked - then didn't. I have experimented and found that I seem to need to turn the knob clockwise to the point that there is no sound. Sometimes this may be at the 1st, 2nd, 3rd or even 4th mark on the knob dial. Why is this? I guess I'm comparing this receiver to a much lessor Sony unit which scanned at any point. Any input would be grateful.

George

Topic: 1771 Message: 1776

hi George:

what you're doing by turning the knob to the right is increasing the amount of s-meter activity which must be present before sound is heard or a scan stops. unfortunately this does not always work perfectly. so turning the knob is telling the cpu 'i want an s-20 signal before you stop the scan'. [s-20 picked arbitrarily]

realize also you can use the squelch without scanning: set it on a pirate station (ex 6955) till you just hear silence... when someone starts talking the s-meter will go up and you'll hear them. what does this gain you? instead of hearing background noise you get silence until the pirate (signal) is present.

also check out in the cookbook 'scan resume' from the setup menu.

as far as scanning goes i wrote a small scan program for myself which uses RS-232 control. i call it 'manual scanning' because what it does is change the frequency at a set pace and lets you listen and stop it. IMO the best shortwave 'squelch control' is our brain... we can hear things in the mud that would be hard for a cpu to destinguish without extensive signal processing. maybe i'll write a useage FAQ and post a copy of the program in the future.

phil :)

i have noticed the same and want to add a fix to the next cookbook.
the unit definitely WILL scan with any of the tuning steps (make sure
you're in the VFO mode). what you should do is go to P1 and P2 and
reprogram them and turn on/off things like the P.AMP, ATT, etc
settings. i bet it is a minor software glitch. please test this out
and report back.

I noticed some errant behavior by the IC-R75 when designing
the Limit Search procedure in my tk75 software.

tk75 has to write the search limits and their associated
settings a few (3) times to overcome a flake in the
IC-R75. The radio sometimes doesn't store the limit information
despite it sending a positive ack after the software writes it.

While trying again, I noticed a couple things:
1. It WILL scan IF the squelch is turned down
2. It actually DOES scan albeit s-l-o-w-l-y
What it does actually is increment 5 khz for every 10th time the scan indicator blinks. Actually, it's not really a problem for me as much as a mystery. To get the desired scan rate, I just have it scanning in slow mode 1 khz at a time. That's plenty slow enough to catch what I'm looking for yet not so slow as to have the transmission completed by the time it loops back around.
FYI I've been chasing the "Cuban Lady" number station around trying to see if I can't figure out how to determine where and when it will be heard next. Been on a lot lately, several times/day at many freqs. Tough job, but it keeps me off the streets...

1783. Kiwa mods review

Yahoo group: icomr75 (2000 — 2002)
Date: 2002-06-16 22:47:05 UTC
From: solderblob
Topic: 1783 Message: 1783

Hello:
I've just posted a copy of my review of the Kiwa mods for the R75 to the files section. This was published in the June issue of the Journal of the North American Shortwave Association. It's in basic text format with line breaks, so should be easily readable. If anyone can convert it (or the original Word format version) to PDF, that would be great.

1784. ? on antenna for R-75

Yahoo group: icomr75 (2000 — 2002)
Date: 2002-06-17 01:13:31 UTC
From: klodtlarry@aol.com
Topic: 1784 Message: 1784

Hello! I am a new R-75 owner, and have put up my first antenna. It is not fancy. It is a Radio Shack sw wire antenna kit. I have it hooked up from my house to a tree up on a hill behind my house. I have the thin lead in wire coming into the spring terminal and the radio on a ground. Now my question. What can I do to improve my antenna? I would like to put up maybe a dipole that I could run coax with. Any suggestions on what you use would be great! Thanks!

LARRY :-)

1786. R75 Execeutive update

Yahoo group: icomr75 (2000 — 2002)
Date: 2002-06-17 01:34:31 UTC
From: jgedde
Topic: 1786 Message: 1786

Hello all,

R75 Executive software is again proceeding. I was foolishly programming the application during a thunderstorm. As a result, the R75 and my PC's motherboard got fried.

The PC was connected to the R75. The R75 was connected to my outdoor longwire. No ground was connected to the receiver. Hence, from personal experience, I can give creedence to the posters who recommend a solid, low impedance ground.

The R75 needed a new RS232 driver/receiver IC. The motherboard wasn't so lucky. The UART got fried. Rather than risk compatibility issues programming an application using a USB/Serial converter, I purchased a new motherboard.

I've since gone through hell and back getting Windows 2000 to run after simply changing out the motherboard. With help from the Win2K resource kit, I was able to format the drive, install Win2k and bring everything back together from a backup hard drive I've been using.

I actually can't wait to start programming R75 Executive again. It's been rainy here all week, so I wasn't able to do much outside. Furthermore, I live in Bethpage, NY and the US Open has been reeking havoc with traffic around here, so I stayed off the road as much as possible.

73's

John Gedde

AJ,

An interesting review, glad to have a side by side comparison of the
Stock R75 -vice- Kiwa R75. I bought my R75 'used' with the
Kiwa Mod Package already installed, and have wondered about the
difference; and now I know. The cost analysis between the Kiwa Mod
Package and the FL-257 Filter was something I had not considered.

Topic: 1787 Message: 1791

hi Samson I'll give it a shot, icom sells about 12 filters for their radios.the fl52a is
a center freq. 455 khz, means it goes in the 455 slot, its for cw you know code.
the fl103 is a center freq. 9.0115 mhz, means goes in the 9 mhz slot, for ssb you
know usb and lsb.
the 52a is 500 hz. wide when on and the 103 is 2.8 khz when on.
Fred's advice, send these back and get your money if possible.
the radio as most icoms should come with 2.4 kHz wide filter for ssb, usb and lsb
narrower then the 103 filter. it most likely has a 6 kHz filter for am, ams., a preset
filter for FM and a tone, mark space setting for rtty. also look at the cook book in the
files for this group. if this helps ask me about psk 31. cul 73, n4aiw

First thing is probably read the recent posts on lightning and grounds.

If you're in to DX, the problem with a dipole is that it has to be very high (more than half a wavelength) to have a low angle of attack, and it has to be supported at both ends. I've installed an alpha-delta sloper which doesn't have to be so high, and only supported up high (about 25 feet) at one end. The other end only needs to be about 10 feet high. They cost about $60. I am very happy with it.

1794. Antenna recommendation

Yahoo group: icomr75 (2000 — 2002)
Date: 2002-06-17 19:13:28 UTC
From: ondatropical
Topic: 1794 Message: 1794

My home QTH is totally awash with electrical QRN from nearby powerlines and houses, and the problem is especially prevelent below 6 mHz, with 60/90 meters totally useless for DX purposes with my 60' random wire antenna.

In an attempt to resolve the problem I did a bit of research on the net and decided that an Active Loop antenna from Wellbrook Communications in the UK might be of some assistance. There are a few reviews on the net and they all reported a very noticeable decrease in local QRN. I contacted Andy Ilkin of Wellbrook (web site: http://www.wellbrook.uk.com)on Friday, June 7 and placed a order for his ALA-330 which is optimized for 3-30 mHz operation. The antenna was mailed to me on the 10'th from the UK and I received the 41" diameter loop in perfect condition on the 15'th via US Mail.

Simply put, this antenna is absolutely amazing and is especially effective from 120 meters up to 60 meters. This antenna dropped the noise floor so low that the only QRN I receive is the usual summertime lightning static. It is amazing to get decent, readable copy on a S3 signal in the 90 mb and then hit the antenna switch to the random wire and hear nothing but a low level buzz. Last night the lightning static died down and I was totally amazed at how quite the tropical bands were. Simpy amazing.

And to top it off, I haven't even installed the antenna outdoors yet! I simply mounted the loop from a string hanging from a convenient ceiling hook in a spare bedroom, ran RG58 from there to amplifier box and my reciever located in the front part of the house then rotated the loop until the noise was nulled and thats all. No more having to drive out to the parents house on the weekend just to do some tropical band DX'ing.

The antenna is effective throughout the HF bands, but the noise reduction was most consistent and reliable from 6 mHz and down. In the higher bands there were times where I could get a better, equally quiet signal on the random but on the lower bands it was no contest.

I highly recommend this antenna to everyone with a super-sensitive receiver like the R75 who lives in a noisy, QRN ridden environment.

1795. Skymatch Active Antenna

> Does anyone have the H800 Skymatch active antenna from LF Engineering? I understand it's a fine antenna and is for the 10kHz through 50 MHz range. Was wondering if it would be better than my radio shack long wire.

I'm not familiar with this antenna, but if you live in a electrical noise-free enviroment then an active whip antenna like the H800 should do well for you. It may or may not outperform a random wire antenna depending on many variables.

Active whip antenna's are sensitive to the electrical field and as such are susceptable to local man-made electrical QRN that is the norm at most urban and suburban areas in the US. An active whip in a noisy locale will amplify the electrical noise right along with the distant signals you are trying to receive.

In a noisy QTH you will find an active loop antenna to be much more practical. Loops are more sensitive to the magnetic field rather than the electrical, and by their nature discriminate against the electrical component of a signal. Also, loops used in the HF spectrum tend to give an omnidirectional pickup on skywave signals yet retain much of their directional characteristics with local, line of site man-made noise sources. In other words, your local QRN source can be nulled out while maintaining basically omni-directional reception on shortwave broadcasts arriving via sky-wave.

The main drawback that I can see is that loops tend to provide less gain than a whip, but with a sensitive receiver like the R75 you are probably more concerned with lowering the noise floor to uncover the multitude of signals present, so this isn't a problem at all except in the quietest of QTH's where you can actually use as much gain as possible without also amplifying your neighbors TV osillator.

Unfortunately, it seems that good active loop antenna's are a rarity and active whips the norm. But if you are putting up with local QRN, spend the extra money for a loop and it will be money well spent.

I'm not an expert by any means, just throwing a few observations out there.

73,

Brandon

1799. Possible Antennas..Thoughts?

Yahoo group: icomr75 (2000 — 2002)
Date: 2002-06-18 03:28:00 UTC
From: klodtlarry@aol.com
Topic: 1799 Message: 1799

Ok, I found some antennas. Anyone have any thoughts or expierences on these? The G5RV and Radio Master P-30 looks interesting and cheap! Thanks in advance! 1) The RadioMaster P-30 is an unobtrusive 15 foot (4 m) passive wideband, indoor/outdoor medium wave, shortwave (500 kHz - 30 MHz) receive wire antenna. It features a built-in matching transformer that ensures 50 ohm impedance so no antenna tuner is required. This omni-directional antenna is very low noise. The P-30 features a 15 foot (4 m) RG-174 coaxial lead-in that is part of the antenna system. It terminates in a PL-259. This antenna and lead-in is completely preassembled. A short length of white nylon cord is supplied if needed for stringing. Made in Holland. Click here to view antenna system and box (http://www.universal-radio.com/catalog/sw_ant/1331a.jpg). 2)The RF Systems EMF Electro-Magnetic Field passive wire antenna is complete and ready to go covering 100 kHz to 30 MHz. The EMF is only 16 feet (5 meters) long and with 16 foot (5 meters) of RG-174 coax and PL-259. The lead in coax is also used as a counterpoise for the antenna. A connection to ground is therefore not required. A special matching network ensures that the antenna is low impedance and makes it possible to connect the antenna directly tho 50 ohm antenna input of the receiver without an antenna tuner. In the center module the received signals are transferred to the receiver by means of a magnetic field. The magnetic transfer technology acts as a screen of Faraday which results in reduced atmospheric noise and interference caused by static. The reception with an EMF is therefore quieter than a normal wire antenna with direct connection to the receiver. The EMF antenna is for receive only and can be used indoors or outdoors. Made in Holland. 3)The Par End-Fedz are a full length half wave dipoles, but with an important difference. The coax connector is at one end of the dipole, where it is most needed. These antennas can be mounted horizontally, vertically or as a sloper. No ground plane or counterpoise is needed. Portable operation could not be easier. Simply had the far end from a tree limb -- the coax is at the bottom. Hang it up in a hotel window or string it up in the attic. End insulators are supplied making suspension easy. The UV resistant ABS plastic housing encloses an efficient matching network allowing the antenna to be fed with common 50 ohm coaxial cable. All hardware is stainless and the SO-239 connector is silver/teflon. The radiator material is a tough polyethylene jacketed, highly flexible #14 copper wire (41 strands of #30 gauge). One end comes with a #10 solder lug making attachment to the matchbox simple and allowing the radiator portion to be replaced if ever necessary. Power rating is a conservative 200 watts. Lightweight (the 20 meter version is only 0.5 pounds), they are ideal for portable work. The all black construction makes them difficult to see. Click here to see an alternate view (http://www.universal-radio.com/catalog/hamwire/4456b.jpg). Model Band Length 1.5:1 BW Order # Your Price Order EF-20 20 Meters 33.0 Feet 300 kHz #4456 $41.95 EF-17 17 Meters 28.0 Feet 350 kHz #4457 $41.95 EF-15 15 Meters 22.0 Feet 400 kHz #4458 $41.95 EF-12 12 Meters 17.5 Feet 500 kHz #4459 $40.95 EF-10 10 Meters 16.5 Feet 600 kHz #4460 $39.95 EF- 6 6 Meters 9.2 Feet 1200 kHz #4461 $38.95 4)The Van Gorden G5RV-E is a favorite low cost antenna. This 80 to 10 meter dipole is fully assembled and ready to install with installation instructions. The antenna is constructed of 102 feet of heavy #14 (7/22) stranded hard drawn copper antenna wire and is center fed with 31 feet of 450 ohm balanced feedline. It includes a center insulator with eye hook. The feedline is terminated with a SO-239 connector for convenient hookup to coaxial cable. List $28.95 Order #0341 $27.95 The G5RV-JR is similar to the G5RV-E above but covers only 40 to 10 meters, is only 52 feet

long and has 17 feet (5.18m) of feedline. List $24.95 Order #2518 $22.95 The G5RV-M is similar to the G5RV-E above but covers 160 to 10 meters, is 204 feet long and has 65 feet (20m) of feedline. List $49.95 Order #0835 $47.95 Thanks! LARRY :-) [Non-text portions of this message have been removed]

Depends on what is happening on the other end of the coax. If you are using the ICE transformer like we discussed a couple days ago, that's redundant and can be actually bad. That's because the system ground is at the ICE transformer and it is tied to the house (safety) ground.

On the other hand if you were using a dipole or doublet or a variant (like a G5RV or T2FD antenna) that didn't require a ground to operate, then you would probably want to ground the receiver. Of course, the better choice would be to ground the lightning supressor *before* the receiver and then not ground the receiver.

I hope this is more helpful than confusing...

Eric,

I contacted cable-x-perts but they don't carry the ICE 180 nor the 182A any longer. Oh well, I think I this point in time I'll keep things simple and continue with my Radio Shack antenna, and safeguard the receiver by disconnecting everything when not in use - and not use during stormy weather. I did copy your previous recommendations for possible future use in the event I want to expand my horizons. Thanks again for all your help.

>
>George

Depends on what is happening on the other end of the coax. If you are using the ICE transformer like we discussed a couple days ago, that's redundant and can be actually bad. That's because the system ground is at the ICE transformer and it is tied to the house (safety) ground.

On the other hand if you were using a dipole or doublet or a variant (like a G5RV or T2FD antenna) that didn't require a ground to operate, then you would probably want to ground the receiver. Of course, the better choice would be to ground the lightning supressor *before* the receiver and then not ground the receiver.

I hope this is more helpful than confusing...

Hi Lee,

This sounds funny. The point of having Kiwa mods is that performing them yourself is rather difficult and risky.

Why pay $35 for $5 to $10 worth of parts? Look in the "Files" area of this grup. There you'll find the instructions about the Synch mod. Version 2.1 is more advanced than what Kiwa offers (I think). It reduced significantly the whistles and makes use of the blinking "S-" on the S-AM (switches to AM detection while the synch is not locked).

Best regards,

Rado

Hi Rado, I agree with you !
Group...
The Rado mod 2.1 (automatic switches to AM detection while the synch is not locked), it is superior to Kiwa that was taken of the Rado Mod 1.0...
inclusive the Rado mod 1.1 are better!
The kit doesn't eliminates the risks on the MC13022, experience should be had in weldings.

1807. More Antenna Questions - Short Version :-)

Yahoo group: icomr75 (2000 — 2002)
Date: 2002-06-19 02:19:21 UTC
From: klodtlarry@aol.com
Topic: 1807 Message: 1807

Ok, sorry for the long post. I have narrowed down my choices. I am going to erect a dipole, buy a G5RV, Radio Master (15' hf/mw/lf wire antenna) or similar. My question is, will a dipole work in this situation: my house is approx 12" tall, there is a hill behind my house, that is approx 6' tall, and that is where I can put up some poles, apporx 10' tall. That would make the antenna a little taller than my house, but is a high point facing the south. I probably have not said this very well. I am trying to get better results than what I am using now, a Radio Shack wire antenna kit run to a tree on top of the hill. I have a MFJ 956 tuner, but that requires coax. Thanks for any help!

LARRY :-)

George,

Just for some light reading in case you get bored...

Go pick up the July 2002 QST magazine; should be available now. On
page 48 there is the second in a two-part series on lightning protection
and how to set up a ground window and all that jazz. I haven't checked
but I think it is reasonable to assume that the June issue had the
first part... but this is the practical part of the series.

Also, if you want to try the ICE transformer anyway, you can buy from
eham.net. That's where I just got my '182.

Hi,

Many www sites have reviewed them with varying ideas on the effectiveness of
them, I use 2 mainly because I can then used a screened lead into the shack
and not have to worry about PC and TV noises at all. I have 2 * 45mtr wires
that I feed with a MLB and about 20mtrs of coax into the shack's room - this
seems to be ideal for me but they say they can work with anything from 12m
and up so I guess its best to play about and see what you get with what
wires!

Oh some people have made comments about the 4:1?? MLB being swamped with
signal levels from large wires and this causes problems -- I guess not being
too much into antennas I cannot say but I know some US people have 9:1??
Rather than 4:1 and this seems to cure some issues.

They are a little lossy but its nothing great to worry about and they also
offer at least the "non" tuneable longwire over the HF spectrum - probably
not the best way but a hell of a lot better for a person who wants to quickly
tune about the bands.

Hi,
Look at http://www.hard-core-dx.com/nordicdx/antenna/feed/index.html .
There you will find comments on the MLB and also a lot of other information on this topic.
The antenna-section contains some good material as well.
I've been using homebrewed coax-transformers for some years now, both 1:9 transmissionline xfmrs and 1:9 or 1:4 xfmrs. All with similar results; gain up and noise down.

(begin rant)

The Magnetic Longwire Balun is three lies for the price of one. It is a matching transformer, but unlike the ICE matching transformer it has no grounding screw on the side, using the coaxial shield as a ground. This hurts its ability to reduce noise.

- Magnetic? No, electromagnetic.
- Longwire? Long wire antennas are several wavelengths long. Random wire is the correct name.
- Balun? No. It takes an unbalanced antenna and connects it to an unbalanced feedline, so it is an un-un. Yes, that is the correct term.

RF systems makes a couple really good products but they bury them in so much marketing bull that I won't buy from them.

For more on the subject of matching transformers, un-uns and baluns, see this web site. Once there, explore the whole thing -- rich with info and opinions, and not just ones that agree with me. (grin)

http://www.hard-core-dx.com/nordicdx/antenna/feed/index.html

For lightning protection, forget "zap trappers" and do it right. Doing it wrong just perpetuates the myth that nothing can be done against a direct strike.

See July QST magazine for a good article. See June QST magazine for background info.

(end rant)

I just *love* the sound of unabashed worship... :-) :-)

Okay, seriously. QST or QST magazine is the full name. The name is
from the 3 letter "Q" signals used in morse code. QST means "attention
all ham radio operators."

A ham radio shop will have it. Bookstores may have it. If you have
a lot of trouble, call the ARRL and ask for a location nearby to pick
it up and look it over.

http://www.arrl.org/qst/

Good luck!

go to arrl.org , then go to eham.net, scroll down to reviews, click on review all and
click on antennas, both dipoles and verticals, read enjoy. by the way if you have a
peace of coax with a pl259 on one are both ends roll it out are round and around
the floor of the room your in, plug it in the so239 on the back of the radio so that
only the center pin of the pl259 is touching the so239 not the outer shield.
enjoy.

Subject: [icomr75] G5RV Antennas?

Well anyone have any thoughts on the Van Gorden G5RV? I can mount this
approx 10' off the ground atop a hill behind m house. Would I need a
tuner
for receive only? Sorry for all the questions. Am narrowing down my
selections!
Thanks!

LARRY :-)

1822. Almost last question! Static build up help

Yahoo group: icomr75 (2000 — 2002)
Date: 2002-06-20 01:52:59 UTC
From: klodtlarry@aol.com
Topic: 1822 Message: 1822

Ok, I re did my ground for my R-75. I used the shield from some RG-58U, and ran it to my main ground, which improved the signal noise alot! I am still worried about the static build up that might damage my radio. I unplug the antenna when not in use. Does the ground for the radio help with the static build up? Thanks!

LARRY :-)

I am curious about the suggestion to lay out co-ax and plug in only the centre pin. What will this achieve that a simple length of wire won't?

Todd

go to arrl.org , then go to eham.net, scroll down to reviews, click on review all and
click on antennas, both dipoles and verticals, read enjoy. by the way if you have a
peace of coax with a pl259 on one are both ends roll it out are round and around
the floor of the room your in, plug it in the so239 on the back of the radio so that
only the center pin of the pl259 is touching the so239 not the outer shield.
enjoy.

Topic: 1810 Message: 1825

hi Todd, the answer is its a simple wire with a cover. question is will it pickup static
are corrode as fast as bare wire inside or outside of the house. say you don't like
roll it out on the floor, you go up in the attic and and you can hang it as high as you
can get it even staple it, don't do this with ladder line, drill hole in the top of one of the walls, inside walls are usually hollow, fish the coax down the wall, go to a supply
house such lowes are home depot get a blank wall plate, one with no holes. drill a
hole in it big enough for the coax to come through close to the radio,screw the plate on the wall. this is given in friendship,it is just a though and experience. i,m cheap
i went to lowes brought a 100 ft roll of number 14 house wire for 8.50 on sale, stipped
the outside cover off and wound up with 300 ft of wire, went over to electric fence dept.
and picked up a bag of the yellow stand off insulators for my dipoles for 80 and 40
meters,hi.

This type of coaxal cable antenna is usually called a "SNAKE" as it is not elevated and can be run around the yard laying in the grass. It can be any length but one hundred feet or more is usual. Just another out of sight out of mind antennas that the neighbors don't see.
.
Basically it is folded randon wire antenna. Using the outer shielding as the end element folded over and encompassing the inner conductor as the near element may provide some noise cancelling features.

I am quite sure that any wire left lying on the grass (folded radom wire, or not) will present some noise cancelling features. Just as it would present some signal cancelling features too!

The lower/closer to the ground you go, the lower the signal and noise (unless you lay the antenna atop some buried power lines). The higher you go, the lower the noise and the higher the signal (unless you are close to some overhead power lines)

I guess someone who has an antenna at optimum height for picking up household interference notices a dramatic reduction in noise when switching to an antenna laying on the ground. However, they should be going the other way!

Todd

That close to the ground a dipole will receive mostly straight up. OK for nearby stations, but not for DX where the "angle of attack" is very low near the horizon. Same applies to a G5RV.

Dear Members,

I am a R-75 user living in Okayama,Japan.I purchased R-75 on May 2002,this is a pretty good receiver,even if not perfect.
Not so hot news for R-75,rather BAD news..
According to the branch office of ICOM in Osaka-City,the firlter FL-96 was discontinued.
I want to buy one,but no stock available,so I deicided to choose FL-257 and FL-103.This conbination is satisfactory!
Now,I enjoy the operation fo R-75 on my automobile,via DC-cigger plug.I will report you this operation in the near future.

Manabu Doi,A Short Wave Listener in Japan

P.S.
We call SWL "BCL" in Japan. The Broadcast Listener.This word is uncommon in USA or Europe,or not?

1835. Okayama

From: Marv Loopstra
Topic: 1834 Message: 1835

Hello
As far as I know, "BCL" is not a common phrase here. I have not heard
it sed at any rate.
I know this is somewhat off topic but I must regardless:
I maintained a corporate aircraft several years ago in Okayama. A
beautiful city. I also maintained the same aircraft after it was moved
to Matsuyama.
I maintained residence here in the U.S. and traveled to your city when
work on the aircraft was necessary.
I enjoyed it very much there and still miss it. Hope to return for another visit
someday.

Thank you much!

Okayama is beautiful city, mainly because it is a riverside-city.
I was born in this city 36 years ago.
But I'll move to other city in near future by transfer. Undoubtedly,
I'll miss...
□@
By the way, the word 'BCL' is common in Japan. I also think it
uncommon in
USA or Europe.
We encountered an enormous climax of □gBCL□h (so-called SWL
elsewhere) at mid-'70s
in Japan.
□gLet's start BCL□h, or □gListen to the world□h were the key words
in those days. The phrase
□hBCL□h□@is believed to be a coinage made by an advertisement
project of some manufacturers,
such as SONY or Panasonic.
But a certain testimony shows the phrase was common in Japan
before '60s.

The climax in mid-'70s produced millions of 'BCL' in Japan. Some
people say,no less than
three million □gBCL□h existed in Japan around 1976. Most of them were
teen-ager,and
I was one of them.
The famous RF-2200 or ICF-5900 were mainly produced for this teen-
ager.
It was very short period ,and most of them have gone anywhere, but we
still stay here,and continue.
□@
Manabu Doi , SWL in Japan.

1839. The mobile operation of IC-R75

Yahoo group: icomr75 (2000 — 2002)
Date: 2002-06-25 14:33:22 UTC
From: manabu662001
Topic: 1839 Message: 1839

About the mobile operation of IC-R75

In Japan, especially urban location ,the noise level is dreadfully high, due to development of
electronically controlled device, such as air-conditioner or room lamp driven by inverter.
So, I prefer the mobile operation. In early days, I used the LOWE HF-225E□Athen I employed
the AOR AR3030.
They were also good receiver. I enjoyed their reliable signal-pulling power.

But IC-R75 is outstanding in □gpleasure of operation□h.□@Since I've been
used to ICOM receivers, such as very old IC-R70, his successor R71, and versatile
stationary scanner R7100, even gigantic R9000. And transceiver IC-750S,similar to IC-R75 in many
respects.

The mobile operation is simple.
R75 locates on the upper side of steering. DC powered by car battery, via cigar plug.
The antenna system is two ways.
One is famous SONY AN-1,active antenna. Thanks to its wide range, smooth and
effective survey from 90mb to11mb is my joy.
The another one is mobile whip HFC-80L□@fed by coaxicial cable and tuned/boost
by RD-9830.□@Rather narrow range, but free from spurious signals. Suitable to 90mb or 60mb.
RD-9830,it is a'70s Panasonic product. An antenna-tuner coupled with 20dB
amplifier. Its dynamic range is somewhat narrow, but no problem for molibe operation.

To locate HFC-80L on the roof, I use a magnetic base.

Operation is simply joyful. I love African-tropical music, as well as Brazilian.
I park my car in the riverside space on early morning or late noon, so-called twilight
time.
The following audio-file (wave) is recorded from my R75 , using an external speaker

AIWA SX-T5. The recording divice is digital type.
http://mav.nifty.com/ahp/textview.cgi?nodxc+14100+235
The files was recorded on June 17, 2002, around 2000UTC. In Japan time, it was
June 18, 2002 around 0500, early morning.
The file number □gwave 4□h is R.TV.Malagasy on 5010kHz
Also □gwave 5□h is Radio Nacional de Equatorial Guinea on 6249kHz.
The last one,□hwave6□h is R.Nederland via Bonaire relay station,on 21590kHz.

Manabu Doi ,SWL in Japan.

Date: 2002-06-27 03:48:04 UTC
From: regularguy01
Topic: 1841 Message: 1841

The K7HOG Field Day team was hosted by Marsh Johnson, KK7CW. The set up was 3a high power with all hf bands in use, as well as a novice station.
I operated at the 20 meter ssb and cw position, as well as the 75 meter ssb position. Conditions were pretty good, with ability to hold a frequency even on 20 ssb with about 350 - 400 watts to a TA 33 JR at 45 feet or so.
Total efforts netted us approximately 1600 QSO's total, with the majority on 20 and 75 ssb.
The operators were Larry, AA0BY, John, K7FD, Harlan, N7HN, Jack, K7QH, Marsh, KK7CW, Chuck, KK7KU, and other operators. There were approxiamtely 35 operators who showed up.
How did everyone else do?

From: DFW1417
Topic: 1842 Message: 1842

Unit is in Excellent Condition. No modifications have been done to this unit. I have been using it on a long wire antenna and it really pulls in the stations, but I have so little time to use it, that I am now selling it. The unit comes with the wall wart power supply but the cable got caught in a chair and was cut so I spliced the cable to repair it. It works fine. I do not have the original box or packing but I will pack it well to prevent damage and ship it to your door via PRIORITY, INSURED, and tracked mail to the US ONLY. Payment is with POSTAL MONEY ORDER ONLY. I trade as Scanman3 on Ebay if you desire references. I will ship the same day as I receive your postal money order. I am selling it for $435.00 plus $25.00 for shipping/insurance for a total of $460.00. Contact me via Email link above. Thanks. Wayne.

Oh, yes it also includes the orignal Manual, Schematics for the Unit I found, along with an alignment procedure if you ever need it and several R-75 test reports I found on the Internet and the ICOM R-75 Brochure. You WON'T be disappointed with this receiver!

1844. Loggins with IC-R75

Yahoo group: icomr75 (2000 — 2002)
Date: 2002-06-27 14:17:58 UTC
From: manabu662001
Topic: 1844 Message: 1844

The following are loggings of my mobile operation on June 26

6184.94kHz R.Educacion(presumed) (SP) 6/26 0932-0937 SINPO33333□`32332
□¨QRMed by a China Station on 6185.00kHz infrequently.
Using 3.3kHz/2.8kHz filters, LSB-ECSS reception.

6180.00kHz R.Nac.da Amazonia (PR) 6/26 0937-0938 SINPO33333
□¨Using a method of the beat-comparison, I confirmed this Brazilian
station having been preserving JUST 6180kHz over a year.

5990.00kHz R.Senado (PR) 6/26 0938-1001 SINPO32332□`33333□@
□¨This Brazilian station is usually overcome with clicky-type
jamming..But,this time he beated it.

9504.90kHz R.Record (presumed) (PR) 6/26 1004-1008 SINPO33332□@

6458.5kHz USB AFRTS-Puerto Rico (EG) 6/26 1009 SINPO23332
□¨With R75's PREAMP-1,the rate of SINPO rised to 33333

All times in UTC.

The equipment was the following.
Receiver: IC-R75
Power supply: Car battery,via a cigar plug
Antenna: AN-1 on the roof (acitive type,made by SONY)
Location: On the top of bank in Okayama-City, Japan

The affinity of AN-1 to R75 is very good. DXing with this system is
very fantastic.
Also with AN-102,which is an indoor type of AN-1, good,but somewhat
noisy,less satisfactory.

Manabu Doi, a SWL in Okayama,Japan

Hi to all:

I sent my radio (R75) in for service about 3 weeks ago...I gave them a call two weeks ago and
they said that they were running behind, but did receive it.
I'm wondering if they have an email address that customer service responds to?
I sent it to the Seattle, Wash office.

Thanks for the help,

Art

Oh Boy:

I sent my radio in about 1 month ago, just got off the phone with Icom.
They said that my radio
worked fine when they got it...Checked it out thoroughly.
I checked the power supply very carefully. It read (if I remember
correctly) about 19 volts D.C.
They are shipping it out tomorrow.
What does everyone recommend I do now?
I'm perplexed.

Thanks,

Art

If you use the provided Icom AC Adapter it will read about 19 to 20 volts DC when unattached to the receiver and read with a voltmeter. This is NORMAL. Remember the provided Adapter IS NOT a REGULATED POWER SUPPLY so the supply voltage will drop once a load is placed on the power supply. That is why it is ALWAYS best to run high dollar receivers off REGULATED 13.8Vdc power supplies whenever possible.

Wayne.

I sent the radio off with the symptoms of being "dead". When plugged in, no display, beeps, audio, anything.
I opened it up, checked the fuse, it measured fine. I checked for voltage across the fuse. It was there on both sides.

They said they found no problems with it...Unless they got the radios mixed up, or the lady was looking at the wrong ticket.
I can't believe it was dead when it left here and had a speedy recovery in the transit...:)

Well, that depends on what it was doing -- or not doing.

What are the symptoms?

No,
I just measured it with a digital voltohm meter.
The first thing I'll do when I get it back is hook it up to my Astron 35 amp supply.
However, my wall wart measured fine. No AC under a load and the DC looked good across the fuse
inside the radio.

Maybe you just had a flaky power switch. Mine sometimes I think I
have pushed it to turn it on and it does'nt come on so I push it
again and it comes on. You hate to think that, but just another
possibility.

Wayne.

1853. Re: [icomr75] Loggins with IC-R75

Yahoo group: icomr75 (2000 — 2002)
Date: 2002-06-28 07:12:19 UTC
From: Todd Gaine
Topic: 1844 Message: 1853

Doi-san,

Please tell me more about the R-75 and AN-1 operation and connection. I have the AN-1 for my SW-77. Doesn't a pre-amp overload the R-75? Do you use a standard AN-1 whip? Do you switch off the R-75 pre-amps?

I have also been interested in mobile operation of my various radios. It would be great to get out of the city, or up a mountain or on the beach and be able to SWL. If only I had the time to do all those things!

Subject: [icomr75] Loggins with IC-R75

The following are loggings of my mobile operation on June 26

6184.94kHz R.Educacion(presumed) (SP) 6/26 0932-0937 SINPO33333☐`32332
☐¨QRMed by a China Station on 6185.00kHz infrequently.
Using 3.3kHz/2.8kHz filters, LSB-ECSS reception.

6180.00kHz R.Nac.da Amazonia (PR) 6/26 0937-0938 SINPO33333
☐¨Using a method of the beat-comparison, I confirmed this Brazilian
station having been preserving JUST 6180kHz over a year.

5990.00kHz R.Senado (PR) 6/26 0938-1001 SINPO32332☐`33333☐@
☐¨This Brazilian station is usually overcome with clicky-type
jamming..But,this time he beated it.

9504.90kHz R.Record (presumed) (PR) 6/26 1004-1008 SINPO33332☐@

6458.5kHz USB AFRTS-Puerto Rico (EG) 6/26 1009 SINPO23332
☐¨With R75's PREAMP-1,the rate of SINPO rised to 33333

All times in UTC.

The equipment was the following.
Receiver: IC-R75
Power supply: Car battery,via a cigar plug
Antenna: AN-1 on the roof (acitive type,made by SONY)
Location: On the top of bank in Okayama-City, Japan

The affinity of AN-1 to R75 is very good. DXing with this system is very fantastic.
Also with AN-102,which is an indoor type of AN-1, good,but somewhat noisy,less satisfactory.

I would ask them if they heated and or cold soaked the unit and
then tested. Sounds like your problem is intermittent and the defective
components can sometimes be isolated by spot heating(heatgun or
oven) or cold soaking (deep freezer or freeze spraying) the radio.
This was a common troubleshooting procedure for intermittent
failures when I worked Aircraft Avionic black boxes. Of course
vibration is another things that could be a factor here since it was
shipped.

On a further note on vibration when shipping...My second R75 came
with the VFO knob loose inside the box completely off the shaft
of the radio. All the vibration in shipping worked it completely loose.
However, trying to remove it again after reattaching it is almost
impossible. Amazing what vibrations from shipping can do!

This does not pertain to the R75 but I just received another radio/
scanner with damage to the clear plastic LCD display screen. This
was the result of vibration of the bubble wrap against an uncovered
clear plastic lense. This radio manufacturer now places a protective
cover on the screen to protect it during shipping.

Shipping a radio can cause many negative or as it sounds like in
your case positive results.

Best of Luck on the R75 holding in there!

Dear Mr. Gaine,

Thank you for reply!
To connect AN-1 to R75, there are two ways.
One:
Using an adapter PL259 to mini-plug.
Such plug is sold by some shops, Universal Radio for example.

http://www.universal-radio.com/catalog/parts/so2adapt.html

Via such adapter and coax cable with SO-239 plug in the each end, we
can connect AN-1□fs controller with R75 strictly.

The another:
Inserting a banana plug to the center hole of the SO-239 antenna jack
of R75.
Also the following URL is useful.

http://www.universal-radio.com/catalog/parts/banana.html

We can connect AN-1□fs controller with R75 via a cable supplied with
AN-1.
The cable□fs ends, one is a mini plug, the other is twin clips
colored in red and black.
For more details, please see photos in the following URL

http://mav.nifty.com/ahp/textview.cgi?nodxc+14100+242
http://mav.nifty.com/ahp/textview.cgi?nodxc+14100+243

As to the overloading, AN-1 sometimes produces mixed spurious signals
caused by the diodes inserted for protection of RF-AMP. But it is
infrequent and restricted to some areas of world band, so not a
serious problem. I□fm using a supplied whip element of AN-1,and the
amplifier is not modified. So, my AN-1 is in stock condition. My AN-1
itself, does not overload the R75 even if the PREAMP-2 switched in.
The exception occurs in the area of medium or long wave. Because the
filters in R75□fs front end are not divided in the area, I observed
some overloading with the PREAMP-2.
The strength of electric field around my location is not so severe.
If you lives in a location where the spectrum is rather crowded, you
may have to go far away and get out of the city for preventing
overload.
The mobile operation is convenient in such respect. I also use AOR
AR3030.
Let□fs enjoy!

Manabu Doi, a SWL in Okayama Japan

1856. Trade For R75 or R8

Looking to trade for MINT Icom R75 or Drake R8 or R8A. Have to trade the
following:

Uniden UBC 3000XLT bought new this year, full 800 MHz, 30 kHz steps for cell
band, beautiful case, telescoping antenna with swivel, manual, battery pack,
PS, barely used.

Also have to trade a Sony 7600GR w/Sony PS, manual, reel antenna, in excellent cond.

Also a Sony AN-LP1 antenna bought new this year.

Topic: 1857 Message: 1857

Is anyone using the Eavesdropper Model T or C antenna? I'm asking as I'm thinking about buying one but I'm concerned about the frequency gaps - it covers 9 of the 12 shortwave bands. I've been using a Radio Shack long wire (which I believe receives the full frequency range) and thought that the Eavesdropper would improve reception. Lastly, I'll be installing the Eavesdropper's 43 foot antenna in an attic and don't want to install one outside. Any thoughts would be appreciated.

George

Hi all.

I am auctioning my ICOM IC-R75 30khz - 60mhz Communications Receiver. This is a great receiver and is in mint condition, boxed with manuals. Includes the DSP and also the Radio Control Software from Icom. Reason for sale is I am buying a transceiver.

See it here http://cgi.ebay.co.uk/ws/eBayISAPI.dll?ViewItem&item=1363774711

Thanks to all. BTW just come from Waddington A/show. Not as good as last visit.

1860. Icom IC-R75 For Sale.

I have a Icom IC-R75 All Mode Communications Receiver For Sale.

Specifications:
Coverage: 0.03 - 60 MHz
Modes: AM, S-AM, FM, USB, LSB, CW, RTTY
99 memory channels plus 2 scan edges
Triple conversion superheterodyne receiver
Selectable RF gain/squelch control
Attenuator
1 Hz tuning resolution
2 level preamp
Selectable AGC
Three timer functions: sleep, power OFF, power ON
Noise blanker
Single touch controls
12V DC Power (120V AC adapter included)

Options included:
Icom UT-106 DSP UNIT: Provides AF DSP functions such as noise reduction and auto notch. ($150.00 option)

Icom FL-257 SSB WIDE: 3.3 kHz/-6 dB ($160.00 option)

Icom SP-21 External Speaker ($120.00 option)

The Icom IC-75 is like new and in Excellent condition. No modifications have been done to it. I have the original owner and have the original box and manual.

The selling price of $600.00 includes shipping and insurance costs within the continental United States via the U.S. POSTAL Service. Payment with a U.S. POSTAL Service MONEY ORDER is preferred.

Please email me direct if you are interested. Do not reply to this message. My email address is: rbird2@...

Thank you,

Rodger

I would go for a nice used one with DSP which are going for around the same price or even less on "e b a y" lately. Bought one myself for $420 and can tell you that the DSP is well worth having. In my opinion the DSP autonotch filter is a must and worth it alone but the DSP noise reduction works well also and really makes it easy on the ears.

Marty

I use a Barker & Williamson AP10-A portable apartment antenna. It attaches to my window when I want to use it. It is very good and I pick up loads of stations. I use an MFJ-16010 antenna tuner with it.

Not bad and a lot better than tossing a wire out the window or stringing something inside.

How well does it work below 3 Mhz, the web page specs say its for 7-30 Mhz.

This may start a flame war, but horizontal vs vertical polarization doesn't matter on HF; the ionosphere scrambles it anyway. You should select vertical vs horizontal based on the antenna pattern you want (verticals are omnidirectional with a low angle of attack; horizontals can be "aimed" to some degree depending on type, but dipoles have a high angle of attack unless they are greater than 1/2 wavelength off the ground.)

...This may start a flame war, but horizontal vs vertical polarization doesn't matter on HF...

Yup, that's because it does matter!

From the Amateur question pool:
(see question #6, click on answers to see True or False
http://www.geocities.com/ResearchTriangle/Campus/2315/T9B.htm)

Question: What electromagnetic-wave polarization does most man-made electrical noise have in the HF and VHF spectrum?

Answer: Vertical

That's why Hams know when we put up a vertical ant. to expect more noise on receive. I can tell you after more than 30 years of using both types (horizontal and vertical polarization) I can verify that horizontal generally (there will always be exceptions) means less noise when receiving. For HF SWL if you have a choice go horizontal.

Except he wasn't referring to whether there was more, or less, noise on a vertical antenna.

The discussion was whether a vertically polarised HF transmission remained vertically polarised after reflection (or multiple reflections) off the ionosphere.

Of course, you are right about the noise on a vertical antenna. And not only Hams know that!

Todd

Thanks for clueing me in Todd.

This is the quote he put from a previous email to show what he was referring to:
> A 40 m dipole home made. An r6000 cushcraft vertical. both work
remember that
> most am and swl stations transmit vertical.

I took this to refer to what would be the best antenna to use in context of the subject "Which Antenna Are You Using?" while receiving AM and SWL broadcast stations and what type of antenna polarization they use but apparently missed part of the earlier comments. Sure didn't want to leave anyone with the impression that they are equal (of course verticals have their advantages also).

Yea, there are a lot of sharp individuals out there that are not Hams, and some hams who "ain't" real sharp 8^)

Marty IR1 - KT4K

-----Original Message-----
Except he wasn't referring to whether there was more, or less, noise on a vertical antenna.
The discussion was whether a vertically polarised HF transmission remained vertically polarised after reflection (or multiple reflections) off the ionosphere.
Of course, you are right about the noise on a vertical antenna. And not only Hams know that!
Todd

At the moment I'm using two random wires, the 1st is 15 meters copperwire running outside at 3-5 meters high. No coax attached, just the same copper wire directly into the antenna-input on the R75. It's the more quiet one of the two and is most effective on lower frequencies (2 - 16 Mhz)
The 2nd is 5,5 meters copper wire running on the attic at 6-7 meters high. The end is connected to 50 Ohm coax leading into ant2 of the R75. Most effective on 20-40 Mhz.
The funny part is that on the higher freqs less signal is received on the 1st antenna, but also less noise. It receives cordless phones on 31-49 Mhz just fantastic because of that.

There's still a lot to discover and experiment with antennas but for now i'm quite satisfied.

Dear members,

Sometimes I use SONY AN-102, which is an indoor type acitive antenna.
This is sensitive, but weak to noise. I encounter some spurious
signals caused by AN-102's arrester diodes.

For a short period in a fine day, an outdoor(mobile) operation is
possible. But AN-102 is more subjet to suffer a radiated noise from
my automobile itself than AN-1.

I'm using a Wellbrook ALA-330 broadband activated loop antenna. This is truly an amazing antenna that discriminates against locally generated QRN sources. I cannot more highly recommend an antenna for anyone in an electrical noisy envrionment needing a limited space antenna that is useable indoors and out.

From: Jem Cullen
Topic: 1879 Message: 1879

I use Alpha-delta DX ULtra, (multiband dipole)fed by coax, and a 30M long random wire, both running north south approx, also coax fed, but without a balun at the coax/antenna join.

the alpha delta is much quieter, but on some freqs can be a bit DEAF i say. but on the freqs where it works, it works VERY well!
the wire is a wire. can be noisy, can be surprising.
i also have a shorter (about 6-7 metre) wire running east-west. this one is anchored to a tree that moves a lot in the wind, so keeps snapping the wire (grin). Its also lower to the ground and nearer the house, so can pick up lots noise.

the last antenna is a CB vertical, retuned for the 10M ham band. being nice and high, a fair way from the house, NON DIRECTIONAL and coax fed all the way, its very quiet.

It works great on the higher freqs, but down low is a waste, beacusee of its tuning.

to me there are some things in favour of verticals.

1- less space needed and eye pollution (in some peoples eyes). I have even seen hidden verticals disguised as flag poles or runing up treetrunks.

2- NON directional, if your garden runs the wrong way for the best signals, you got problems, also if ur garden runs broadside to a big city or lotsa noise/interferance sources.... besides most us want to hear things from all corners of the globe.

3.. low angle of radiation. seems when these sigs skip off the ionosphere on the greyline, they come in very low angle to the horizon. Verticaals are better at low angle then horizontals i have heard.

4.. they only need one anchor.. my dipole is between my house a tree and a big pole in the middle 3 anchors. the wires need two, the vert just sits on the one pole until they get so big they need guy wires
. tend to weather storms better too!

that said if the wife was to say to me i got too many antennas I gotta get rid of some, i would divorce her.... no hang on i was gunna say i would ditch the vertical.

Here's a couple of links to shed some light onto
the antenna polarity question mentioned earlier:

"ALYX ANTENNA GUIDE"
http://www.antenna.be/

http://www.antenna.be/art4.html

http://www.antenna.be/art1.html

Most of this info. is from the SW Broadcaster
perspective.

I use a Vertical Telescopic 42" whip directly
attached to the R75. Works quite well except
it's a little short for the Broadcast Band 530-
1700kHz. I am planning on upgrading to an
attic mounted Horizontal Dipole shortly. I
just have to build it up!

Being new to shortwave, etc., I'm wondering whether my indoor shack antenna installation is sufficient for receiving many of the stations expected of the R75. I am receiving stations but I expected more. I think Eric mentioned a pirate station at 6955 but I can never seem to receive it. I realize I have an indoor antenna and it isn't as good as being outside, etc., but I think I should be receiving more of them. Can anyone provide average stations that you think I should be receiving based upon my indoor Radio Shack antenna? Thanks,

George

Hi George:

I use a 20 meter long random wire with a `Doty low noise feed line'
(http://www.anarc.org/naswa/badx/antennas/low- noise_antenna.html.)
I find that this setup has noticeably less static on medium strength and weaker strength signals than similar antennas using normal insulated wire feedlines.

1889. IC R75

Yahoo group: icomr75 (2000 — 2002)
Date: 2002-07-05 01:38:29 UTC
From: kabjkm2002
Topic: 1889 Message: 1889

I was interested in purchasing the IC R75 until I started reading the posts at this site. There is no way I'll spend $600 for a radio that has to be modified to work properly. I can listen to SWBC stations in ECSS mode on my ham transceiver. Kim AB7JK

1890. Modifying the R75 needed ? Maybe yes maybe no

Yahoo group: icomr75 (2000 — 2002)
Date: 2002-07-05 02:26:54 UTC
From: W. Charles Alexander
Topic: 1889 Message: 1890

Hi Kim et all:
First off, let me say one thing the R75 is a very fine Receiver, just as it comes out of the box!
That said, yes, it's sync is not that of a Drake R8B. But I did not expect it too.
NOW . . .
You want to talk about Receivers there are NO perfect Receivers, And I have had a lot of high end Rx,s to use (R8B, R7, R4C loaded with Xtals, NRD 535, Collins HF-2050, Colins R390A, SP600 Ten Tec RX-340 and on. I just sold the Ten Tec RX-340 a bit ago.
It was an awesome RX ... At 3950.00 it should be, BUT, hey you know what? The guy I sold it to went out and bought a Sherwood SE3 Sync Detector to make it have the best Sync available 500 + more $$

Morel of my rambling is:
Pick a price range, and the features you want and go looking.
The R75 fits a lot of peoples needs as it is priced way under the "Big guns" Like Drake R8B, NRD545, AOR AR7030 not to mention the Ten Tec RX-340 or others or even a Really cool looking Yaesu FT-1000 Mark II !!, yet it performs well.

Cheers Charlie

Don't let the fact that there are modifications available for the R75 bother you one bit. It is a fine radio just the way it comes in the box. You can find modifications for most ANY radio that is made. The fact there are several for the R75 does not mean that they must be performed in order to make the radio work properly. It is a matter of personal preference. I have been using a variety of receivers since the mid 1950's and the R75 stacks up well with any I have used, including military equipment.

In case I have not made the point clear..... I like my R75 :)

1892. Electrical Noise - 2 Questions

Yahoo group: icomr75 (2000 — 2002)
Date: 2002-07-05 14:13:32 UTC
From: Moxie3
Topic: 1892 Message: 1892

How does one know whether you're receiving electrical noise or just plain static? I read somewhere that electrical noise can be heard as popping sounds, whining sounds, etc, which I do not have, even though my antenna is located in the attic. When I receive a strong station, there is no noise whatsoever, perfectly clear. But when searching for stations, I hear mucho static. Is such static inherent in shortwave?

==========
If the noise is constant and doesnt change much in pitch or magnitude
its probably man made, whether it is a whine, or a hiss, or buzzing or what
ever. Usually mother natures noise is fairly non constant and varys quite
a bit. If you live near any high voltage power lines, especially if there
is a bad connection the noise this generates will be a steady humming with
popping and hissing sounds and is extremely annoying, been there done that,
I moved. When listening to shortwave there are times that are just plain
better or worse than other times, to me lately the bands seem fairly noisy
so I use the R 75s NR and it works fairly well. Give it time, sometimes
the bands are perfect and you can hear things you have never heard before.

Let it be known that, contrary to what is sometimes written in this group, the R-75 does not have to be modified to work properly. Yes, the mods may enhance performance, but that is an entirely different thing. Any radio can be enhanced with mods. There is no such thing as a perfect radio. Manufacturers compromise all the time to meet cost and schedule demands. I have yet to do any mods to my R-75. I love it just the way it is and don't intend to do any surgery. For its price point, the R-75 performs great right out of the box. I can't think of any radio in its price range that does better. I would say that if your transceiver has all the features you need for SWLing, then I agree there is no reason to buy a R-75. But, for the non-hams out there (like me) the R-75 is a great receiver.

Regards,
Bob

Topic: 1896 Message: 1896

Hi all

I was reading through the past postings on scanning the UTE's. One modification that I did to my old R71a was the addition of a syllabic squelch subsystem in place of the existing comparator-operated squelch. This allowed for the scanning to be stopped only upon the receipt of an actual voice signal. It also allowed the monitoring of a channel without atmospheric or other noises to open the squelch. The R75 would be a much better candidate for adding one of these squelches internally due to it's more flexible scanning and plenty of space inside. The only minor problem that I can forsee is that there is an absence of a front panel "hard" switch that can be re-assigned for activating the circuit. Would anyone have any suggestions for a toggled logic level that can be accessed from either a front panel switch or menu set-up option? I haven't bought a service manual yet for my R75 yet, but some possibilities include the dial lock or the antenna terminal switching. I plan to do the same with my IC-718 as well. For any of you that are interested, here's a link to one source for a syllabic squelch module.

www.naval.com/vos.htm

RadioKit also use to sell a pretty good copy of Motorola's Constant Sinad Squelch that was used in their HF Micom product line for about $50. I don't know if they are still around. There isn't a single manufactuer of comercial HF transceivers (including Icom's M700/710 series) or for that matter any commercial duty HF receiver that doesn't use a voice operated syllabic squelch made in the past 20 years.

Any suggestions on a front panel point to activate one of these?

1897. FOR SALE: Mint Condition R75, Loaded

Yahoo group: icomr75 (2000 — 2002)
Date: 2002-07-06 20:57:22 UTC
From: icomfandan
Topic: 1897 Message: 1897

Moving out, selling entire amateur radio/SWL station. I have a 4-month-old IC-R75 with InRad and ICOM I.F. filters, UT-106 DSP unit and UT-102 voice synthesis installed. Works perfectly, superb cosmetic condition. This receiver comes with a "matching" Drake external speaker, Radio Shack headphones, a cassette recorder for logging QSO's/DX, recorder control and audio cables for connecting to R75, original UNUSED ICOM a.c. adapter "brick", R75 carton and instruction manual, plus a copy of Passport to World Band Radio! A complete listening post, just add your antenna, for $725 including shipping to any ConUS (48 contiguous states) destination.

This may seem a strange place to post this sale, but I am hoping there will be someone looking into buying their first R75 or who knows someone who would like this station gear. No scavengers or "tire-kickers", please...this equipment must go, I am not breaking it up into pieces and components.

The price of the filters, voice synthesizer, recorder, headphones and receiver cost over $900 plus shipping, purchased individually. Save a bundle on this package outfit!

1898. Cable TV & Computer Noise

Yahoo group: icomr75 (2000 — 2002)

From: ic0mr75
Topic: 1898 Message: 1898

First, sorry for the less than original nickname. I was lacking imagination the evening that I signed up. Secondly, I have been experiencing some noise from my cable TV line and my computer, so I hooked my R75 up to my 70' longwire with RG-8, then from the end feed point, I ran the outer shield to a 8' ground rod beneath the feedpoint. Sadly this did not stop the noise, and it seemed that it made my antenna less sensative to weak signals. Finally, I tore it all back down, and fed my antenna with the 12 gauge wire and ran it to the 500 ohm connection at the back of the radio along with the ground connection. While I still have some noise, I'm back to being able to hear the weaker UTE signals. Does anyone have any other suggestions?

Did you ground the RG-8 at the radio end also. I ran coax to my longwire and grounded it at the feed point. I didn't really loose the static until I grounded it at the radio end.

Yes, at the feed point I ran the outer shield to the ground rod with
a length of heavy gauge copper wire.

Ahhhhhh......I didn't ground it at the radio end. That's why I still had the noise I bet. Thank you for the suggestion. I've seen a ferrite rod thingy that wraps around computer cables for noise reduction. Would this make any significant improvement also?

The shorter the open wire at the radio end, the less noise you will pick up if the coax is also grounded at that end. My radio is near the computer. I have about 3 inches of open center conductor from where I split the outer shell from the coax and ran to the 500 ohm / ground inputs. I also have a ground wire from the ground input to my house AC ground (to lazy to run an additional wire). Works fine.

Look in your manual and their might be a screw are wingnut on the back of your radio that's marked ground. This is where the wire to the ground rod goes. computers and there power supplies are noisy period,some more than others. Fr chokes may not help but they will not hurt either give them a try. static and noise is a summer time thing that's been happening since radio, it happens more in the daylight than real late at night are during thunder storms even distant ones. This will lighten up in the winter months.

I'm a novice at this radio stuff so take what I have to say with a grain of salt. If I understand what is being said, a straight wire is connected to coax, then split again to the spring loaded clips on the back of the radio? In any event, I am under the impression that when you go from the straight wire to the coax, you should do so with a matching type transformer for proper impedance.

1906. Longwire Antenna Matcher - Improves Shortwave Antenna Performance

Yahoo group: icomr75 (2000 — 2002)
Date: 2002-07-07 23:31:19 UTC
From: Moxie3
Topic: 1906 Message: 1906

Longwire Antenna Matcher - Improves Shortwave Antenna PerformanceThis is what I was trying to say; let me know what you think. Also, I understand ICE makes a few models which do the same thing, available through Universal Radio and the same price. Let me know what you think.
Longwire Impedance Matcher

Improves Longwire Performance
and Reduces Noise
This simple device connects to the end of your longwire antenna and converts it's high impedance to a lower impedance expected by the radio. This allows a higher percentage of the signal picked up by your antenna to be transferred to the radio. Works on just about any shortwave radio with an antenna jack.

When mounted outside, the matcher will reduce the amount of household electrical noise entering your radio because shieled cable is used to connect your radio to the impedance matcher.

- Covers all shortwave bands
- Increases signal strength
- Reduces Noise*
- No adjustments required
- Stainless hardware for long life
- Fully weatherproof
- Tolerent to extreme heat and cold
- Impact resistant
- No batteries or moving parts
- Works with or without a ground connection
- Uses standard 50 ohm lead-in cable and standard PL connectors.

*Only when used outside.
ACCESSORIES
Includes butterfly nut and crimp terminal for easy connection to antenna and ground. We stock copper wire, shielded cable and insulators so that you can make your own longwire antenna.

WARRANTY
Iron clad 1-year replacement warranty. If your LIM fails within 1 year of the date of purchase we will replace it FREE of charge. (details included in documentation.)

PRICE: Only $39.00!

> in ECSS mode on my ham transceiver. Kim AB7JK
>

Hiya Kim,

I have to agree that there are a lot of modifications for this RX, but there again, until I got onto the list, I wasn't aware that the 75 needed modifying...
But.....at the end of the day, its all down to what you use it for - for me it does great for BC bands and data modes - and to be honest I'm not really all that bothered about the sync-am mods, never really saw much use for it on the HF-150, which i'd had loan of at one point... But the PBT is great, and its a lot better than my R-2000 was, but then again, theres 15 or so years difference between the two - the only real moan (if i was forced to make one) would be the speaker - too small, I'd have rather had a top mounted one ! (put it through some headphones though and its great)

And lets face it, my R-75 knocks my FT-100 out of the water on RX, but then again, the FT-100 is
doing 2 jobs.... (and if theres ever a TX on the planet that has more mods than the 100, show me !)

My advice is this - put it on the bench and listen - you may find it works to your tastes as it is, add the DSP and some filters, yes (i've just got a plain vanilla one) but even without them, its a great piece of kit...

To echo another comment on the list - you do not have to mod the 75 to get it working properly. :)

For the price and features - you can't go far wrong - and lets face it - other than Icom, theres not a lot of RXs out there at the right price....

just adding my 2 cents

I've had my R75 for about a month and I'm just getting familiar with its operation. But I can tell you this, count me as being very satisfied with this receiver without any mods. I believe it's worth more than $600 but, as with most everything, you get what you pay for.

1909. Re: [icomr75] Re: Cable TV & Computer Noise

Yahoo group: icomr75 (2000 — 2002)
Date: 2002-07-08 07:49:46 UTC
From: n4aiw@aol.com
Topic: 1898 Message: 1909

if this was addressed to me i will go and try to answer it any way.
coax is unbalanced line, it comes mostly in 50 are 75 ohm impedance, examples rg58 rg8 rg213 rg8m rgx 9913, all 50 ohm search Belden wire. these wires use the
so 239 screw in connector with a pl259.
the two wire connectors are for balanced line ,so called twin lead. yours may be marked as 500 ohms. TV twin lead is rated 300 ohms, ladder line is rated 450 ohms and theirs a guy that sells 600 ohm ladder line.
why use coax because it can be ran close to metal objects, rain gutters. metal siding, metal windows, cars, fences, etc. and not be as effected as other line.
why use twin lead because its an antenna as soon as it leaves the two connectors in the back of the radio, its very effective unless its passed through a metal are any near by metal object then it gets effected some times badly. since this is a balanced line you can run any of these twin lead ladder lines.
OK for ground, the wall wart, power supply for your radio is probably two pronged, if threepronged you may have a ground, two may not are a bad ground you know half assed. your metal chassis on the radio needs a ground to bleed off the static and entermode that the chassis may have. this not an antenna ground, use flat wide copper strip, wide flat braided cable are any big cable. i use a fat aluminum cable that i bought at radio shaft(shack), put a hook on it with needle nose, beat that end flat with a hammer and hook it over that ground screw i told you about and screw the screw back in to hold it. i then slid a gray little piece of pvc pipe over the ground wire, it sets on my window sill so the ground wire doesn't come in connect with my metal window and frame and cause another mess. this goes straight to a 4 foot ground rod.
random length ants are just that. they can read from off the scale to 0 ohms at best their make do ants with the idea that the more wire you put up the more you will hear. to use with coax go ahead and buy it with the pl259s on it, screw one in the back of the radio, put coax out window, cut off the other pl259 discard it. remove about 5 inches of the outer jacket on the coax take a tooth pick nail punch and undo the outer braid with this done twist the outer braid until its one 5 inch long wire. remove about 3 inches of cover from the center wire and solder the center wire to the end of the random wire. take the outer braid and solder it to a piece of wire to go to the ant 8 ft ground, if you want add radials around that ground rod and clamp them and ground together. DONE**********
dipoles the basic ant take 69ft random wire down divide length by two and cut in middle take center insulator pull one wire through one side and twist it back on its self about 5 turns do other side the same on other end of insulator take coax wrap it back over it self over the center insulator use plastic ties to keep it in the middle and over the center insulator. solder the center wire to one of the wires and the braid to the other wire put-up

DONE**********
ladderline divide 69 ft by 2 cut ladder line down the middle this length with what ever you can use put up in the air strip other end back a little and put in connectors in back DONE**********
right on postit note snake oil baluns and tuners for swl
pull up ground rod and radials put in out building say bad words
look up n4aiw on call box on QRZ.COM have laugh
go to arrl .org buy antennas and wire book
now i be done, see you later n4aiw

ic0mr75,
.
One item that you may wish to consider is bad household wiring.
.
WHAT ??? Sometimes the internal wiring in a house is miss-wired.
.
Simply go to a Home Depot, ACE Hardware, or OSH Hardware and buy a simple home Electrical Outlet Tester. Looks like a BIG Three Prong Plug Adapter. The Electrical Outlet Tester has the three prongs and three LEDs. Just Plug it into your electrical outlets and check which LED's are lighted. If the Test is OK 'no problem'. However, if the Test is bad 'fix the problem'. One outlet in a room can be OK and the next one can be bad: test them all.
.
What's in the electrical circuit path ???
If you are using 'Safe Power Distribution Strips' on your computer and audio equipment: Temporarily remove them and Re-Test for noise.
.
Check-Out All
* Room Light Dimmers Fluorescent Lights.
* Outside & Yard Lights that are Mercury & Sodium Vapor.
* Fans, Ceiling Fans, AC, Air Cleaners and electrical motors.
Simply Run a 'noise test' Item On and Item Off.
.
mkia ~ RHF
.

You could have a bad (i. e., ungrounded) cable connection somewhere. Cable modems work in the HF band, although I have one 5 ft from my receiver and have not had problems, but with a bad ground, who knows? Also, your cable can bring in noise from other people's houses on the same branch.

Thanks for the responses. I kind of miss the old days of FRG7s. I'm trying to decide between the ICR75 and the RX320. So many issues - the softwate, noise problems, configuration problems, price etc. It seems like the more information I receive the harder it is to compare the two rigs. It seems like using software to control a SW receiver is a fun toy, but computers and shortwave listening just don't mix - too many compromises. The idea of having a device that reproduces a one microvolt radio wave while keeping out all other RF sources is absurd. Maybe live streaming over the internet is the best solution. Maybe live streaming is boring because it is so easy? What does that say about all us techies? Kim AB7JK

It says we love our hardware!

I still have an FRG-7. Bought one, loved it, traded it away, bought
another one.
I found that there is a completely different thrill in dialing in
some unknown station on a frequency that you're not really sure of
than there is in clicking on an entry in a spreadsheet and instantly
having the radio lock onto it and hearing exactly what you choose.
The "frog" requires dialing 4-6 knobs when changing frequencies
1-Band select
2-Preselector
3-MHz select
4-Actual frequency
5-Fine tuning
6-Mode
But isn't it fun to hear a far away station moving that little s-
meter needle with the warm incandescent dial lights while listening
to it in a dark room? That big front firing speaker softens the
sounds and really brings out the fidelity that many SWBC stations
really broadcast.

Don't get me wrong, I love my R-75. The R-75 instantly locks onto
SSB signals without the need to warm up a drifty BFO and it can knock
down heterodynes instantly. The twin PBT beats IF shift hands down
and the variable RF gain works great at reducing background noise.

I just want to say that if you want the best of both worlds, have
both rigs!

<hint> if you want to try out an R-75, get a used one with the DSP. After you've tried it out, in the event you don't like it (I'll bet you will), you'll probably be able to sell it for what you paid for it. Even if you lose a few $, think of it as a rental fee and you'll realize what a bargain it is.

1914. Shortwave Antenna Deal

Yahoo group: icomr75 (2000 — 2002)
Date: 2002-07-09 18:30:37 UTC
From: Moxie3
Topic: 1914 Message: 1914

Was browsing antennas and noticed that Barker & Williamson is having a close-out of multi trap listening antenna, 11 through 60 meters, 35 feet with SO-239 connector or with twin lead feedline for $25 plus shipping, regular $71. I think they are getting away from the "listening only" antennas. Just thought I would pass this along. If you are interested, access their web site at www.bwantennas.com and click on "Web Specials", then click on the "ASW-60" antenna.

Yea, I had an FRG7 for about a year. I liked it but the selectivity was wide as barn door and the audio was somewhat bassy. It seems like every rig has something wrong with it that you become more and more conscious of the longer you own it. Maybe I'm too particular. I tell you, aside from the rebuffering, live streaming is deinitely the best audio. The number of stations available isn't bad eather. AB7JK

before you hit warp speed please consider this, the r75 is basically a icom 718,746 pro,756 pro2 with out some of the bells and whistles, but with some of its own bells and whistles. for example a clock all swl and ham radios should have a clock on them. you can run this thing on the wall wart, a power supply, are a battery. it has both the so 239 for coax and a 500 ohms connector for ladderline. i could go on and on but heres the magic, its the Fr gain control, when your listening look at your s meter and back off the Fr gain just until the hash marks are past the signal peaks now adjust the volume,agc,att,preamps this is common on most of the icoms and the older good swl and ham receivers.
bye, n4aiw

1918. R75 or streaming audio

Yahoo group: icomr75 (2000 — 2002)
Date: 2002-07-10 12:09:30 UTC
From: Jem Cullen
Topic: 1918 Message: 1918

STREAMING audio over shortwave? PLEASE! no-no! u got it wrong. I mean you may as well watch TV! it aint about the audio or the choice. its about digging them out!

saying streaming audio is better is like saying, its better to go to the fish shop then to go fishing, or better to go to the greengrocer then to grow ur own, better to get on your cell-phone then to call cq-dx on 20 Metre band.

sure one has better choice, always works has almost guaranteed 100% success but so what...

one has pride, mystery, art, craft, excitement (and frustration)
Anyone who considers streaming audio an alternate, should probably NOT buy an R75.

they should buy a cheaper outfit, that would do fine for bbc/voa/hcjb etc, like a sony handheld or a Lowe (still damned good with great audio), spend the rest on broadband and pc equipment.

if its just about SWL (BCL) to "news and entertainment) the R75 is prob overkill.

MY r75 is great. Its not my favorite rig that Ive ever owned, I think that would be a drake ssr1 . Its not even my fave i own right now, that would be my TS440S. but it is the BEST i have ever known. best audio, best sensitivty, best selectivity (ok i had a kenwood r5000 was better there, but it had full house of optional filters, this has only std ones).

Its just out performs any rig ive ever owned. i listen to my r75 nearly all day and night both for local MW news n talk, and serious DX sessions. Why ain it my fave? I dunno, a bit like when ur 50 and u lookback over all the cars u owned, and the one makes u misty-eyed is a 69 VW or somethin.....

Larry, you're probably speaking to the wrong guy. I ordered the coax because I have the single wire Shack antenna going to the spring loaded clip. I thought that by going with the coax I could alternate antennas if I so desire. But coax does seems to be the choice feed. How are you grounding the receiver?

I have a "main shack" ground system consiting of a 12" copper pipe mounted under my desk, and I have all of my radio gear connected via lugs to this pipe. I use the copper braid (outer shield) of coax, tinned on one end and a lug on the other. Seems to make a drastic improvement over what I had before.

Absolutely. When I still lived in the Netherlands I could hear
all of Europe (well, except for Iceland and Malta) on an old
tube radio with LW, MW, 49 meters and FM, using a random wire
antenna for LW/MW/SW and a dipole for FM.

I used to dig various stations out of the noise, or just enjoy
the music from Ireland, Croatia, Italy, ...

10 years later I have a (home-brew, of course!) T2FD antenna
and an R75.

I'm _still_ digging unknown stations out of the noise and
enjoying music of far-away countries ... and it's just as
new and exciting as it was 10 years ago.

Of course, the R75 allows me to listen to more stations
than I could have heard with the old radio and it pushes
the limits of my antenna, but that just means I have to
go out into the big blue room and put up a better antenna ;)

regards,

Rik

I got my start in SW back when I was about 12 years old, about 1982. I had traded an old bike at a pawn shop for a multi band radio. I loved it, as I could hear the police, fire and shortwave! My first station I heard was Radio Havana Cuba, and I sent them a letter. They sent me tons of neat souviners! I was in awe from that point on! It still amazes me how I can hear broadcast from all over the world!

LARRY :-)

From: kabjkm2002
Topic: 1932 Message: 1932

I've been listening to a new R75 for several hours. It seems to me Icom went out of their way to make the lowest fidelity radio they could make. Even on SSB the rig sounds muddy and dull. My Sony SW10 sounds better in AM except for the fading distortion. The FT 840 sounds like high fidelity compared to the Icom in ssb mode. The Icom reminds me alot of the RS DX100 circa 1980 - which sold for $100. In fact in the Icom ads the ICR75 looks brown but in reality it is black and even looks like the DX100 except for the plastic case and the analog dial. I bet they have the very same audio sections! From reading the posts in this group it seems like everyone new to the R75 has the same low opinion of it's audio. People who have used it awhile feel the audio is good. A matter of conditioning I suppose. I may have too many good sounding rigs to put up with this one for very long. Just too painful a listen. AB7JK

You obviously haven't had time to learn how to use the set properly yet.
I'm curently tuning in MW yanks in the Xband, & loving the ability to pull them out of the Hash, & I'm in South Australia. Do you have the DSP unit? I do but rarely have to use it.
Give it a little time before knocking a very good DX machine..
The other receivers are portables only & really only for general shortwave listening.

From: Jack
Topic: 1934 Message: 1934

Hi all,

Im new to the group and would like some comments on what sort of antenna's people are using with the R75 ,i have had mine for about 3 months now and i think its the best thing since sliced bread ;)

My main listening area's are Military comm's and low band VHF skip ,what sort of antenna setup do you recommend for this?? ,i mainly listen between 5mhz and 21 for military stuff and of course 32mhz to 38mhz for VHFlo stuff.

I currenty have a Semi inverted V cut for 8.5mhz (about half way between the frequencys i listen to) ,and this doesnt seem to be doing a real good job ,im getting alot of 'hash' type noise and fast type of crackling noise ,i have the DSP unit fitted and this does help to reduce some of the rubbish all though it still burys some of the weaker signals! ,sometimes there is not real bad interference just your regular 'Shhhhhhhhhhhhhh' background noise yet the signal meter is showing near 9+ signal ,is this normal?? ,it makes it awfully hard to determine a lowish signals real strength ,i have a good earth connection (2ft copper pipe buried in the ground outside the shack window with heavy duty guage plastic coated wire off that in to the R75) ,could i have multiple legs running from each side of the V cut for different frequencys? or wouldnt this work? ,oh the V is also connected via a 1:1 Balun ,then fed with RG-213 coax.
Any other antenna plans/ideas would be greatful (the maximum amount of wire i can get out in the yard would be about 30ft tops ,and only about 20ft in height!)

For the Low band VHF i have modified a 27mhz halfwave StationMaster antenna for 33mhz ,this was put on a network Analyzer and tuned till it was -36DB at 33.72mhz ,so far the skip here in Tasmania is nil so i cant see if my handy work is a winner or not! ,anyone else have any good low band antenna designs?

Ok think i have said enough for my first post!!

Cheer's,

Jack

P.S would any of the Mods for the R75 benefit my listing area's??

Lew, have you tried the different settings of the NR control? While listening to one of your stations, "press and hold down" the NR button until the NR level numbers pop up on the display (everything else will temporarily disappear). Slowly adjust the VFO knob to get rid of all the background noise without distortion to the received signal. This is a DSP function and will certainly make most receiving more enjoyable!
Marty

I doubt this will help much but, a typical ground rod is 8 ft. into the ground. Sometimes conditions are bad and you will get more or less noise. Do you have above ground power lines near your antenna? If you have the room, you might try orienting your ant perpendicular to any power lines...

>Just too painful a listen. AB7JK

First of all Kim, try listening to it without the NR function. The speaker is optimized for voice communications and I think it is as good as most HF transceivers, maybe better than most on SSB. It IS pretty pathetic for SWBC listening, especially music from a good signal, but try using a good external speaker. You'll see that the fidelity really is there, it's just lost when going through the speaker. That's a lot more than I can say with some rigs where the fidelity is lost within the electronics and no external soud system can bring it back. Also, as the other posts say, try using AS LITTLE DSP noise reduction as possible. The DSP does great at knocking down heterodynes, but is not a "magic bullet" at eliminating static or QRM.

If you can't stand the pain for too much longer, I'll trade you an IC-745 for it :).

Hi Jack:

Welcome to the group!
I've had good results with a random wire antenna with a `Doty low noise feed line' It's main virtue is a reduction in local electrical interference
(http://www.anarc.org/naswa/badx/antennas/low- noise_antenna.html.)

I find that this setup has noticeably less static on medium strength and weaker strength signals. My background noise measurements have dropped by s3-s5 (compared to insulated wire feedlines). I normally do broadcast listening.
Hope this helps!

Regards
from Ottawa

Maybe the person using it before you had set the filters so
that you are listening thru the narrowest filters available?

I think the R75 have a great audio for SSB, but I use an external
speaker. I've never tuned in any BC stations so cannot vouch for
it?s music fidelity, but for unid stations it sounds just fine
to me. Filter selections and the PBT controls lets you adapt the
filters to match any kind of signal. If I receive a strong noise
free signal on both the R75 and my DX394, the R75 have way better
audio quality using the same type of external speaker.

Ubbe.

Second that, forget the internal speaker, the lows on good SSB audio (like the HFSSB Hams) through decent headphones/speakers is great if your filters are not set too narrow. Also noticed that the higher the NR number the less fidelity. NB can cause distortion, etc. A little patience and experimentation with the controls goes a long way with the newer DSP radios.

I was thinking about getting the optional Icom speaker and was wondering if anyone has it and their satisfaction with it. Also, is the Icom speaker amplified?

I have a set of amplified Koss speakers in storage used for personal audio which I haven't tried with the R75 but assumed that the Icom would be a better choice. Any thoughts?

George

1947. IC-R75 running with car battery

Yahoo group: icomr75 (2000 — 2002)
Date: 2002-07-12 22:01:08 UTC
From: manabu662001
Topic: 1947 Message: 1947

Dear members,

I tested to run R75 powered directly by car battery,not via cigar plug.
Some noises,for example around 7.919MHz are reduced. The noises are caused by the computer systems of automobile, I presume.

The following are loggings with R75,on July 12
(Thanks to Mr.Kenji Takasaki)

3373.5kHz USB a feeder of NHK Radio 2 0917-0918UTC SINPO34333
3259.0kHz USB a feeder of NHK Radio 1 0920UTC SINPO34333
3607.5kHz USB a feeder of NHK Radio 1 0921UTC SINPO34433
These chs are a back-up for emergency situation. A interesting games for serious DXers in USA or Europe?

This was the mobile operation with AN-1.

I think the audio of R75'internal speaker is not so satisfactory. But with an external speaker, the result is good. I use AIWA SX-T5 and YAESU SP-767.

Well, my R-75 with all the Kiwa mods just arrived. It's not a Drake R8B, but with a good external speaker, it sounds just fine. I'm using a Optimus (Radio Shack) X7 speaker.

Having fun and Phil, I printed your cookbook. used the receiver for about one hour without opening the manual. Finally getting around to reading the Icom Manual and Phil's cookbook.

HI Les:If you want to see good reviews about the R-75 performance with some mods surpassing other receivers,check in the search archives in this group[write drake in the box]and then search and read the reviews.An remember the R8B don't have:DSP,TWO PRE-AM,aut notch,coverage up to 60mhz,. If has you posted you have all the kiwa mod's now you have 2.4khz,3.8khz,6khz filters,a working sync det,and your R-75 surpass the R8B in sensitivity and in SSB reception. The R-75 tunning is in 1hz increment the R8B can't tune in 1hz increment.With both receiver you need an external speaker for a best sound reproduction. An you save about $600.00 with the mod R-75.

Yes Phil:Muddy and dull sound?Hmmmmmmmmm.To my experience the r-75 has a crispy[more high's than low's]sound.I installed a $14.00 Radio shack pc speakers and now the sound compare with any of the pro' "shortwave" receivers.

> Well, my R-75 with all the Kiwa mods just arrived. It's not a Drake
R8B, but
HI Les:If you want to see good reviews about the R-75 performance
with some mods surpassing other receivers,check in the search
archives in this group[write drake in the box]and then search and
read the reviews.An remember the R8B don't have:DSP,TWO PRE-AM,aut
notch,coverage up to 60mhz,. If has you posted you have all the kiwa
mod's now you have 2.4khz,3.8khz,6khz filters,a working sync det,and
your R-75 surpass the R8B in sensitivity and in SSB reception. The R-
75 tunning is in 1hz increment the R8B can't tune in 1hz
increment.With both receiver you need an external speaker for a best
sound reproduction. An you save about $600.00 with the mod R-75.

>>

Well, I wasn't worried about saving $600.00, I just happened to get this R-75
with all the Kiwa mods and needed another solid state receiver in my
workshop. It happened to be available.

That said, it is a pretty good receiver, especially with the Kiwa
modifications. I had operated one side by side with my R8B several months
ago, it was a stock R-75 and there is no comparison with this Kiwa modified
R-75.

But, I'll stick with my opinion of the R8B being a better receiver. Of
course, it is qquite a bit more expensive, so it should be.

Enough said about the two of them as this is a Icom R-75 list. I'm enjoying
it as I earlier stated.

Dear Mr.Moxie3

Neither is amplified,they are passive. I prefer SP-767 in fidelity, but SX-T5 is handy for mobile operation. I can plug my headphones via SP-767, the fidelity is better than when directly connected. I don't know the reason why.

Hi:

The R75 is a communications receiver, not a home entertainment stereo receiver. I have not looked at the R75's spec's, but I can tell you that normal audio bandwidth for good communication quality is 2700 hz (300 to 3000 hz) and there is no way it is going to sound as nice as most any FM receiver. However, the human voice has most of the recognizable intelligence contained within the 300 to 3000 hz bandwidth. Anything more than that does not substantially contribute to understanding what is being said.

Years ago, the ARRL published and article on a passive audio filter which restricted the audio the narrow bandwidth mentioned above. I built several, and with the exception of the R-75 have found very few receivers that did not benefit from using it for pulling weak signals out of the noise.

Hello! The speaker is 8 ohms, and is a satellite bookshelf speaker from a surround system. I purchased a JENSEN Surround system, but I only needed the center channel speaker and the sub woofer. So I had 2 rear satellite speakers, and 2 front bookshelf speakers. They soound as good or better as the Icom SP-21 (which I have and compared them to). I am using the Jensen speker now as the speaker for my r-75. So to make a long story short, I have 3 speakers that are extras. I do not have a digital camera, but will try to take a pic and scan it in. The speaker is just a hair taller than the r75, and is black and looks real good next to the rig.

Hi all,

Could some kind person please explain the filter setup for the R75?

I have a stock standard unit and im abit confused as to what filters should be selected when setting up the filter menu ,also what is the 'Exp on/off' feature in the filter menu and what does it do?? ,i hardly listen to any am ,99% is SSB ,so what settings should be set to what??

Also would i get any improvement by adding more filters and what one's would i benifit from for my mode of listening??

Thanks in advance!

Jack

1965. Ground Wire Type & Gauge

Yahoo group: icomr75 (2000 — 2002)
Date: 2002-07-13 14:02:03 UTC
From: Moxie3
Topic: 1965 Message: 1965

I've read a couple of posts about using a thick as possible ground wire. But the R75 connection doesn't seem to accept a very heavy gauge wire. I have about a 75 foot run from receiver to ground rod and was thinking about running 16 or 14 gauge copper stranded wire. I know have 16 gauge but it seems pretty thin. Should I try 12 gauge from the ground rod up to a certain point then switch to 14 or 16 gauge? Also, does it matter if the ground wire is insulated?

Coz i got an opinion on everything, I gotta talk about this too!
lets swap stories how we got into radio, and what we love about it.

Lets see It all started with me in the late 70s or early 80s in high-school, i got a Realistic DX100 at a RatShack Clear out. A friend who knew a little about radio made me "windom" dipole out a speaker hook-up wire. Heard BBC, VOA, R Moscow, (Hey remember "Radio station Peace and Progress"?) HCJB etc, I was hooked!

After a few years the old DX100 died (OK i tried t fix it once too often & killed it) and i discovered girls and drinking, left school, got job, lived in innercity etc, no radios.

Anyhoo, one day perusin the classifieds I spot a Drake SSR 2nd hand. This was about 1988. started my second wave of radios. ended up getting my ham ticket(but like others I found ham radio not so interestin, might use a mic once twice a year), lotsa different radios went thru the shack over 5-6 years.

THen i had kids, and got into serious computer studies few years.. sold all the radios.

Then one day a few years later (about 2 years back) I was perusing the classifieds, i spot a VHF/UHF scanner for sale..... here we go again said the wife....

Subject: Back on SW

I finally broke down and decided to buy the ICR75 today and return to the hobby. I went QRT from the ham bands about a year ago (got tired of the ssb ops who think anyone running less than a kilowatt is a schmuck; the shallow qsos about pending colon operations and who ran into whom at Dayton; tired of the boring repititious name-qth-rst's of cw operating). The only thing likeable about ham radio anymore is psk31 but I don't like to type! - Much rather monitor it which brings me back to SWL where I started out with on an old nine (as advertised!) transistor thumwheel tuned Admiral radio ($9.95) forty years ago and heard WLS Chicago unexpectedly one night under the

covers. I guess I'm returning to my roots. By the way - I don't mean to sound too critical but why don't some of you members cut loose once in awhile? Does everything have to be about filter mods and antenna impedance matching? Can't we learn and have fun too? Kim AB7JK

I use a speaker that Radio Shack sells. It is a RCA model XTS-50AV. It is inexpensive ($19.99, it is on sale for $14.99 quite often). It is shielded if you want to place it near a crt. It looks good, the black matches the IC-R75 very well. And it sounds FANTASTIC! It uses a SINGLE 4" driver. You do not want a tweeter for this application. A tweeter will degrade the sound (you hear too much hiss).

They are cheap enough, give one a try, I BET YOU WILL LIKE IT!

Here is a link for them: http://www.radioshack.com/product.asp?catalog%5Fname=CTLG&category%5Fname=CTLG%5F002%5F006%5F002%5F000&product%5Fid=40%2D5024

My name is Frankie. I have been read only for a while and enjoy the group. Keep up the good work! Here is my web page if you would like to take a look: http://users.chartertn.net/FHUNT/ You will not see the speakers in the photos. One is behind a mic and another has been added to the top shelf. I plan on getting another one when they go onsale again.

hi Jack:

my CookBook in the files section speaks about this briefly. basically there are two filters: one at the 9 MHz and the other at the 455 kHz IF (intermediate frequency). you turn EXP on if you purchase an optional filter. i would set things up like this:

SSB (normal) 2.4 kHz and 2.4 kHz
SSB (wide) 15.0 kHz and 6.0 kHz

in the 'normal' mode you can use the twin PBT (turning in opposite directions) to narrow the bandwidth. use the 'wide' for quickly tuning AM stations received as SSB (see the CookBook). also an inexpensive way to increase fidelity if you listen to AM as SSB is with the 2.8 kHz (@ 9MHz IF) filter. what kind of listening do you do?

phil :)

I also have the Koss and several other types/brands of speakers. Everywhere I try to put the Koss speakers to use I find them disappointing compared to the others.
Marty

Thanks for that phil!

I mainly listen to military comm's ie. 11.175mhz ,8.992mhz 8.122mhz etc etc ,plus i like to chase VHF low band skip (32 - 38mhz) ,and also the hams!

What sort of antenna setup are you using with your 75?

Cheer's,

Jack

Subject: [icomr75] Re: Question

hi Jack:

my CookBook in the files section speaks about this briefly. basically
there are two filters: one at the 9 MHz and the other at the 455 kHz
IF (intermediate frequency). you turn EXP on if you purchase an
optional filter. i would set things up like this:

SSB (normal) 2.4 kHz and 2.4 kHz
SSB (wide) 15.0 kHz and 6.0 kHz

in the 'normal' mode you can use the twin PBT (turning in opposite
directions) to narrow the bandwidth. use the 'wide' for quickly
tuning AM stations received as SSB (see the CookBook). also an
inexpensive way to increase fidelity if you listen to AM as SSB is
with the 2.8 kHz (@ 9MHz IF) filter. what kind of listening do you do?

phil :)

hi George, a couple of things, your radio should be as close to ground as possible.
75 ft is way too long. you can buy flat one half to one inch copper strap are braided
copper from several suppliers, try www.aeshams.com. as for the hole drill bit are a nail with a hammer will make a good hole that will work.
my station is next to a window i use some 8 ground from radio shack about 10 ft long
. As for insulation what kind of smoke test do you want.

Topic: 1965 Message: 1977

Maybe I could reduce the length to abut 60 feet; is this still too long? I can go shorter to about 40 feet but the ground will be my house ground which I thought I should stay away from. Also, are you saying to use one half to one inch braided copper strap instead of using wire? Never used copper strap before so please clarify.

George

From: just_rtfm
Topic: 1963 Message: 1978

hi Jack:

i use 50' of wire wrap indoor as an antenna... not really ideal. if you listen to hams/utes what you'll want to do is use dual 2.4 kHz filters and turn the PBT's about one white notch in opposite directions. this will narrow the bandwidth... do more if it is crowded. by moving them in non-standard ways... ex. moving just the inner knob about two spaces to the right... you will adjust tone. the CookBook in the files section has this and many other tips you may find useful.

regards,
phil :)

George,
.
Ground Rods:
* The more metal in the ground - the better.
* The more dispersed the metal in the ground - the better.
* And, 'independent' ground source from the house electrical ground - is better.
.
Ground Lead-in Wire. (Main/Trunk)
* The 'shorter' the wire - the better.
* The 'larger' the wire - the better.
* Some say the wire should be: 'solid', 'stranded' or 'webbed'
.
Ground Bus Bar/Strap.
Note: These are solid and heavy and usually have several holes with screws to make a firm connection.
* For more than one radio/receiver 'use' an in-the-shack ground bus bar.
* Run your incoming 'main' ground wire to the ground bus bar.
* Run the shortest ground wire 'branches' to each piece of equipment that requires a separate ground connection. (Avoid coax ground loops)
* Run the largest size branch wire for each piece of equipment.
* If needed 'terminate' these branch wires with a 1" wire that fits the individual piece of equipment's ground terminal.
.
R75 Ground 'branch' Wire. (From a Ground Bus Bar/Strap.)
* 'Terminate' the R75 branch wire with a 1" wire (or solid pin) that fits the R75's ground terminal.
* If you do not use the RS-232C Jack on the back of the R75. You can build a ground branch wire with a two terminal lugs about 2" apart at one end. Use a two screws that fit the two mounting post holes of the RS-232C Jack. Attach your two terminal lugs at these dual chassis ground points.
.
As My Daddy use to say... You Are Grounded !
.
~ RHF
.
- - - In icomr75@y..., "Moxie3" <moxie3@e...> wrote:
> I've read a couple of posts about using a thick as possible ground wire. But the R75 connection doesn't seem to accept a very heavy gauge wire. I have about a 75 foot run from receiver to ground rod and was thinking about running 16 or 14 gauge copper stranded wire. I know have 16 gauge but it seems pretty thin. Should I try 12 gauge

from the ground rod up to a certain point then switch to 14 or 16
gauge? Also, does it matter if the ground wire is insulated?

Didn't say this but I should have. The longer the run to ground the more resistant it is to drain off static, it becomes what I call a floating ground. the wider the ground the less resistant.
Yes, braid or wide solid copper.
Cable x-perts half inch 10 gage,rated at 53 amps,59 cents a foot
polyphaser corp. low inductance copper strap comes in 1.5 to 6 inches wide.

==========

You guys are taking this grounding thing way too seriously. Wire is measured in Ohms/1000 ft. #12 wire has 1.59 ohms/1000ft so 75 ft would give .119 ohm.
This would not give you a floating ground. To bleed off static this would be fine.
Your better off paying more attention to the grd rod than the wire size. Depending on soil conditions, a good 8ft grd rod will be a good choice. In the old days people thought they could save their radio equipment from a lightning strike by having massive grd systems, aint gonna happen. I dont care if you use 500MCM copper wire your radio is gonna be toast.

Hi, I looked in the Radio Shack catalog and noticed the RCA speaker mentioned in the other post for $19.95, but the speaker is for computers and other things. Radio Shack does have a speaker for scanners, shortwave, etc. for $14.95. I wonder whether the speaker for shortwave would have better voice sound versus the RCA speaker which may be better for music. Has anyone compared them?

OK, tell me one last thing. Since I'm using a single wire Radio Shack antenna which connects directly to the spring loaded clip (antenna side) on the back of the R75, where should I connect the ground for the antenna? I am already using the other spring loaded clip for my ground to a cold water pipe.

You can do it one of two ways....either get a lightning arrester (universal radio and others) put it at the feed end of your longwire and run a wire from the arrester to a ground rod. Or, do it the econimical way, run a wire near where the longwire is terminated to the insulator closest to the receiver, to a ground rod. But, be aware that not all soild will complete and make a good ground connection. Just installing an 8ft. ground rod and a wire doesn't mean anything in certain cases. dry soil conditions etc. vary. Best to use multiple ground rods. Or, do what thousands of us do and don't worry about it. If you have a static noise problem, a ground won't help.

1993. Re: [icomr75] Ground Wire Type & Gauge

Yahoo group: icomr75 (2000 — 2002)
Date: 2002-07-14 22:53:24 UTC
From: Jeff Santee
Topic: 1965 Message: 1993

<< I'm not so concerned about lightning but about grounding the chassis and
static build-up. >>

Then run a ground wire from the antenna to ground.

I've been swl and bcb dx'ing since 1957, and have NEVER grounded a receiver.
It's one of those legends that won't die. Tried it once, no difference was
noted.

Les Locklear
++

Les

I for the most part agree with what you say. I use a longwire with a matching xformer
and coax lead in, and dont even bother with grounding my reciever. I dont get any static
build up on my radio. However if you use just a longwire with a wire lead in, in the winter
with the wind blowing and low humidity you can (depending how long your longwire is)
build up substantial static charge, hundreds or even a few thousand electron volts.
Enough of a build up to knock you a good one when you touch your radio, providing
you are grounded. I only say this cause Ive been there done that. I had a FRG 100
sitting next to an Icom R 100 and the FRG would build up enough of a charge to jump
the gap between the 2 radios. And when I would touch the FRG it would snap me a good
one. It got grounded to the nearest copper water line after that. (with #14 stranded)
Thats one of the main reasons I now use a magnetic longwire balun (matching xformer)
on my rig, plus using coax to the reciver its much quieter with this arrangement, and no
static. I have tried my R 75 with and without a ground and like you, dont notice any
difference. So I suppose you could say depending on what you use for an antenna
makes a difference whether you need a ground or not. My original post was just to
say you dont need large diameter wire and multiple ground rods etc for a decent grd.
If your lucky enough to have copper piping in your house, one of the best grounds
you can have is running a wire to a cold water pipe. You will be in effect hooking up
to perhaps miles of underground pipe.

1995. Speakers and grounding

Yahoo group: icomr75 (2000 — 2002)
Date: 2002-07-15 03:31:38 UTC
From: Jem Cullen
Topic: 1995 Message: 1995

On back to back testing with my TSS440S for audio (thru the same headphones same signal A?B audio switch) The Icom tends to be more "Bassy" and rounded. WHeree the KEnny is more toppy and harsh.
This can make the spoken word txs a bit more distinct on the 440 then the r75, where they can be a bit softer. Also sometimes (especially on ECSS-USB) the audio can "disappear" on the icom, I find detuning .01 or .02 and shifting the passband brings it back.

That said, the icom is much more pleasant for long term listening then the kenwood, the kenwood's harshness seems to bring out all the static and crashes that the icom hides. ALso this is with r75 DSP ON (about 3). turning DSP off brings audio UP to more kenwood like tones.

This is balanced to some extent by the ICom speaker, which is small and shrill to my ears. I got an external speaker on day 1 and have never used the built in speaker (urgh). I use PC multimedia speakers, first from KOSS, which i liked a lot. but now i use Hercules XPS210, which are 5 way sub/sat set up.

I listen to this set up all day! I think the audio is superb! (with DSP on). I really love the icom audio thru decent external speakers. I use it for general local news/talk/music radio and ute/swl/bcl/dxing. For serious dxing i will prob use headphones. MY pk232 seems to decode digital stuff better from the icom then the kenwood, but there aint much in it. (both on std factory IF filters only, no options) and if u think the icom AGC is too fast, you should see the kenwoods -its hyperspeed!

Quick word on grounding. I didnt install a ground system til about 6 month ago. I only have about 5-6 foot copper in the ground, anbnd about a 10 foot run of wire leading to it (so its only half a ground). I used RG8U as my ground lead (shorted both ends so both the centre and the braid carry same current). I connected every bit of equipment in the shack to the ground. I found the difference astonishing. The noise/static/rubbish level dropped dramatically. and weak signals became much easier! Aint that enough reason to put one in?
The PC used to wipe the radio on some freqs. now i can hardly tell when its on (Except for real serious dxing). I imagine there is some static protection and NO lightning protection, but i still disconnect antennas before bed everynight.

just my observations.

1997. PL-259 Connector

Yahoo group: icomr75 (2000 — 2002)
Date: 2002-07-15 19:52:13 UTC
From: xxjavapxx
Topic: 1997 Message: 1997

I played around a little bit with my antenna setup this past weekend. I have been using about 100 feet of bare copper wire as an antenna. Been pretty happy with that wire thrown around my backyard, connected to the high impedance push connector. I purchased some lengths of coax with PL-259 connectors, and borrowed a vertical antenna (with an SO-239 connector) and a dipole (cut for 20 meters, used the center connector on one leg, and the shield going to the other leg) from a ham friend of mine. I have found that if I screw in the PL-259 barrel connector to the SO-239 plug of the R75, I get less signal strength than if I just use the center connector. The difference in signal strength is quite dramatic. The same thing happened with the dipole. I also tried ladder line to both ends of the dipole, to a short length of coax. Same result. The bare wire handily outperformed the coax fed antennas. Can somebody help me sort this out? Why does screwing in the barrel connector result in a signal loss?

Thanks!

Thanks for all the resposes to my original post. I've been busy working. To all those who vigorously defend the Icom audio "methinks you protest too much" which means I hit a raw nerve which means I'm right. As such an AM sync mod is not worthwhile.
It is a pretty hot set though. With a 30ft wire in a tree the bands come alive. The first night Kuwait and Zimbabwe were easy catches. Also there is very little background noise even without the DSP. One thing I notice - when I scan up the band manually I need to continually adjust the RF gain - dynamic range could be better. The AM sync seems to work best with RF gain turned down and the sound routed from record out to amplified speakers. Next I plan to hook it up to an 80 meter half square. AB7JK

What is the height of your 30 foot wire? Which way is it facing, north to south?

The synchronous detector on my Kiwa modified R-75 works great. I leave the rf gain alone. That's the way it should work.

Just my 2 cents.

Hi Jack,

Go to the files section group's website and in the 'information' folder. Jem Cullen has an excellent spreadsheet of all the filter options there. This should give you an idea of what the best settings are for your existing filters and what the best options are for with additional filters for your favourite listening modes.

The EXP ON / OFF function turns on and off your extra optional filters.. ie If you have an extra optional filter, the 'EXP ON' allows you to be able to choose between 2 filters (either 455kHz or 9mHz - you can have a maximum of one extra of each)

I consider that in an otherwise excellent user's manual, the section on filters is very poorly written and took me a while to comprehend. I finally worked it out after a bit of fiddling about.

My set came with a 1.9kHz filter from the previous owner, and I got the 3.3kHz filter extra. So I have a very useful range of filters to suit my interests, BCL DX and entertainment, and voice utillities.

Hi guys,

I simply used ordinary computer speakers (amplified). If I were a purist, I'd use a good quality communications speaker to reduce any chance of RFI from the speaker's power supply. But for ordinary entertainment listening and every day use, the computer speakers are fine. As someone else said, the comms receivers aren't expected to be HIFI.

If I'm really straining to hear, I use my stereo earphones!

The best SW sound I have ever heard was from my dad's old mid 1960's Sony TR911 transistor SW/MW set. After than, the Kenwood R5000. I kept my R5000 after I picked up the R75. I love the sound quality out of that set.

2005. FL-102 for R75

Yahoo group: icomr75 (2000 — 2002)
Date: 2002-07-17 09:16:29 UTC
From: manabu662001
Topic: 2005 Message: 2005

Dear Members,
I purchased the filter FL-102, which has 6kHz width suitable for AM.

Installation of FL-102 to R75 is just easy, no soldering is needed.
But, in the setting mode, the selection must be done in pretext
of "FL-103". The number "102" doesn't exist on the setting mode of
R75.
NOT as FL-100 nor 101, we must choose "103", because when selected as
100 or 101, R75 recognize it as a cw filter, then changes the range
of TWIN-PBT from +/-1.29kHz down to +/-0.258kHz
In the filter set mode, the FL-102 "FL- 103" can be selected as
AM-wide or AM-normal filter in 9MHz IF.
It is displayed as "2.8" on R75' LCD panel.
I set filters equipped with R75 in the following ways

For AM-Normal (Middle)
6.0kHz/6dB FL-102 in 9MHz IF, and 6.0kHz CFWS450HT in 450kHz IF.
For SSB-Wide:
6.0kHz/6dB FL-102 in 9MHz IF, 3.3kHz FL-257 in 455kHz IF
Full 3.,3kHz bandwidth available, this is good for SSB reception.
But, as to the ECSS reception via SSB,(we call "beat-zero" in Japan)
the sound is somewhat fluttering.

They are out of rules explained in R75's manual. But the fidelity and
selectivity of FL-102 6kHz-filter is satisfactory for listening.
Therefore, my IC-R75 acts like old IC-R70, which is equipped with FL-
102(or other equivalent) in 9MHz IF.

Unfortunately there is only one slot available for 9MHz IF filter.
So, I detached already installed FL-103 2.8kHz filter.
I also prefer FL-103. The combination of FL-103 and FL-257 is very
suitable for ECSS reception. It is more sufficient for SSB-Wide than
that of FL-272 and FL-257.
With some detaching and soldering, replacing FL-272 to FL-103 is
possible. But I cannot determine yet.
Still more unfortunately, the FL-102 is now discontinued, Nominally
this filter is an option for IC-775DX2. They are also discontinued. .
I found FL-102 unexpectedly. I thank God.

Manabu Doi, a SWL in Okayama Japan

Hi George,

As far as i know its an 8ohm Stereo Speaker ,its off my old stereo system and its not amplified ,i have got a small pair of JS Amplified Computer speakers that i am going to try next ,would these sound better hooked to the speaker out on the R75 or are they better run of the rec jack?? ,the speaker i have on it at the moment is connected via the speaker out jack.

Jack.

Hi Edwin,

Thanks for your helpful info!

I have read the 'Cookbook' and have got all my filter's worked out nicely!!

It's sounding alot better ,also took someones advice and hooked up an external speaker.....my what a difference that makes!

Thanks for all that helped me out :)

Jack.

Edwin,

When I tried my Koss amplified speakers, I had to place the volume control on the speaker to max level to hear normal sound. And the volume control on the receiver did not affect the volume on the Koss speakers. Also, since the receiver isn't stereo, I got sound from only 1 speaker. Is this the way your amplified speakers are working?

Hi guys,

I simply used ordinary computer speakers (amplified). If I were a purist, I'd use a good quality communications speaker to reduce any chance of RFI from the speaker's power supply. But for ordinary entertainment listening and every day use, the computer speakers are fine. As someone else said, the comms receivers aren't expected to be HIFI.

If I'm really straining to hear, I use my stereo earphones!

The best SW sound I have ever heard was from my dad's old mid 1960's Sony TR911 transistor SW/MW set. After than, the Kenwood R5000. I kept my R5000 after I picked up the R75. I love the sound quality out of that set.

Jack,

My understanding is that amplified speakers should be connected to the "rec" jack. I haven't had very good sound from my Koss amplified speakers but others have. So you have to try and see whether you like the sound.

Being My Normal Butt-In-Sky :o)
Here is my two cents worth.
When you use your Two Koss Speakers connected to the 'REC' output on the rear of the R75. You need to use a 1/8" Mono-to-Stereo Adapter between the R75 and the Koos Speakers. This will give you a mono input for both stereo channels of the Koss Amplifier and drive both speakers equally.

Topic: 1963 Message: 2010

Edwin,

You are absolutely right, but for some reason, even with the mono to stereo plug, still no luck. Setting my volume to the highest point on the speakers is like volume being at a number 4 on a 10 point scale. Maybe my plug is bad or the speakers are bad. I'll try another mono to stereo plug and see what happens. Thanks

George

2011. Re: The speaker subject

Yahoo group: icomr75 (2000 — 2002)
Date: 2002-07-17 19:47:45 UTC
From: Ubbe
Topic: 2011 Message: 2011

I've tested a bunch of speakers of different types including active ones and also run the audio throught the soundcard of my PC. And my opinion are that with a strong signal that are noise free, almost all speaker types sounds different but all have good audio quality, if the speaker isn't broken or damaged.

But when the signal level drops and the audio begins to sink into the noise floor, then you really begin to skilja agnarna fr?n vetet.

The best external speaker I've heard that makes the voice more readable and filters out most of the noise, are the Motorola small lunch box speakers. Sadly they are discontinued now and have been replaced with a similar looking type that have a ribbed plastic front instead of a metal mesh front. I managed to snag a couple of speakers before they where out of stock, and there are several part numbers for them, the only difference being the type of connector used, SSN4005A being the type I have. The new speakers have a terrible audio that only enhance the noise and not the voice.

But the old speakers still doesn't beat the performance of the internal speakers of Pro-2042 and DX394 that are absolutly superb for monitoring voice audio with noisy signals.

I did see a speaker advertised for shortwave and was digital to suppress noise. I'll have to try and locate them and get more info. Have you tried the Icom speaker?

I've not tried the Icom, but another specialized SWL speaker which I think was for
a Kenwood. It was expensive but did not impress me. The M speaker where better.

Marv, since I last wrote, I had assumed that the shielding plate is the metal part under the unit, seen by taking the bottom receiver cover off, not on the side. I took this part off thinking it was the shielding plate. That chrome plate on the side I mentioned is 5 inches long and flat. Please confirm which plate. Thanks,

George

I don't recall that it is that long but I do seem to remember that it
is under the bottom cover and looks like the picture in the manual.
The plugs are also evident.
I think you are on the right track

I went ahead and used the insulating cover. With the insulating cover in place, the unit was snug in its fit within the cover, so I didn't use the velcro tape. You think it's ok as is? Couldn't figure where the heck to place the velcro. I started it up and it works fine.

Use the ones in the R-75 manual -- I believe it explicitly says this
there as well.

The UT-106 predates the R-75, which is why the instructions are broken
down the way they are. And, yes, you will have "leftover" pieces intended
for the other radios.

The sleeve isn't used on the R-75 -- only on the PCR-1000.

Jim, I wish the instructions would have indicated that the shield is located on the bottom of the unit. So be it. Thanks,

George

It would be the ONLY removable plate on the bottom side of the radio.

What does this look like and where is it? The diagram doesn't seem
to show the plate.

Topic: 2029 Message: 2029

Hi all,

I am re-doing all my antenna's this weekend ,moving them further away from the house.

I am going to bury my coaxial cable under the ground and im wanting to know do i have to put the cable in PVC tubing or can i just bury the coax as it is? ,at the present time all my antenna feed points are close to the house as i was always led to beleive that the shorter the run of coax from antenna to receiver was better ,however i have since read that this may not be the case and that the closer the feed point to the house the more likely it is that interference from the house wiring could get into the setup causing lots of interference?

Before i go ahead and and move everything i would like to hear some comments on my intended plans ,antenna's going up will be an inverted 'L' (about 40ft length ,20ft above ground) ,inverted 'V' (about 26ft length ,18ft above ground) and an end fed Longwire (about 26ft length 18ft above ground),the only balun used will be a 1:1 on the inverted 'V' ,Should i use baluns on the other 2 antenna's aswell? ,coaxial cable used will be RG-58cu/Milspec ,will this cable be adequate or should i go with the heavier gauge RG-213? ,are there any plans to easily build baluns as the one im using on the 'V' was purchased for $75 and i would prefer to build than buy!!!

Thanks in advance,

Jack.

Eric,

Evidently I had a choice of using the insulating sleeve or the velcro tape; I went with the sleeve because I thought that the manual predated the manufacturing of the DSP/sleeve. I wish Icom would have included instructions with the unit as I know the manual is a few years old. Thanks,

P.S. Finally received the ICE catalog and wanted to ask you a question but I forgot what it was. I'll get back to you later.

Use the ones in the R-75 manual -- I believe it explicitly says this
there as well.

The UT-106 predates the R-75, which is why the instructions are broken
down the way they are. And, yes, you will have "leftover" pieces intended
for the other radios.

2031. Re: The Speaker Subject

Yahoo group: icomr75 (2000 — 2002)
Date: 2002-07-18 02:45:08 UTC
From: radiohighfreq
Topic: 2011 Message: 2031

Ubbe, George and All,
.
I have been using a Kenwood SP-430 Speaker with the R75 and it did out perform the R75's internal speaker across the board: normal voice, weak signals, music, and at high volume. But it cost me $100+ on eBay to have a matching speaker for my Kenwood R-5000. However , the SP-430 does not match the R75 - Sounds Great! But... No So Pretty.
.
I have been reading the posts recently in the eGroup about 'speakers' and decided that I would give the RCA Speaker that some of the members have written about. Went to the local Radio Shack store and asked for Catelog Number 40-5024: RCA 20 Watt Full Range Mini-Speaker; 5" Cube; Body & Grille are Black. Comes in a RCA Yellow and Black 6" Cube Shaped Box. Here is a Link to the Radio Shack WebPage for this Speaker.
http://www.radioshack.com/product.asp?catalog%5Fname=CTLG&category%5Fname=CTLG%5F002%5F006%5F002%5F000&product%5Fid=40%2D5024
.
Side-by-Side Tests of the three speakers: R75 -v- SP-430 -v- RCA 40-5024.
I M H O - The RCA Speaker is the Winner Hands Down - Period.
Be It Listening To: Normal Voice, Weak Signals, Music, or at High Volume.
* Voice is Crisper and Fuller Sounding at Low and High Volume Levels.
* Better then the SP-430 with weak signals.
* Best Sounding for Music.
* And Oh Yes... It Looks So Pretty next to the R75.
At 'Only' $20 this RCA Speaker is a Keeper !
.

From: Ubbe
Topic: 2012 Message: 2036

I don't remember the installation being tricky in any way. I could only stick the card to one place using the velcro tape, if the cabling would be routed the most logical way. That leather pouch could not be used and the instruction specifically informs that it is solely for protecting when installing in one of the units which I belive where the PCR1000.

Most people seem to praise it's noise reducing capability, but I find it useless as the amount of noise reduction are exactly linked with the amount of distorsion added to the voice audio. I´ve never found the NR to make any voices step out of the noise and make them more intelligable regardless of any setting of the DSP. And I think I know why. My excellent external speaker already have such an efficient way of reducing noise and enhance voices that the DSP cannot improve anything to it. But the function of the automatic notch filter are really helpful and that alone makes the DSP worth having.

Ubbe.

Just looked over the instructions again.
It IS pretty vague, isn't it? Hope you got it all figured out and
are enjoying it by now. It CAN make an intelligible signal out of an
otherwise muddy bunch of noise.

Topic: 2012 Message: 2037

I stuck the tape to the underside of the DSP then carefully placed
the unit where it goes (not THAT critical) and stuck it to the
chassis. As long as it ends up under the shield plate...

I also was refering more to the ANF than the NR in making the signal more readable.

--- In icomr75@y..., Ubbe <urban@h...> wrote:
> I don't remember the installation being tricky in any way. I could only stick the card to one place using the velcro tape, if the cabling would be routed the most logical way. That leather pouch could not be used and the instruction specifically informs that it is solely for protecting when installing in one of the units which I belive where the PCR1000.
>
> Most people seem to praise it's noise reducing capability, but I find it useless as the amount of noise reduction are exactly linked with the amount of distorsion added to the voice audio. I´ve never found the NR to make any voices step out of the noise and make them more intelligable regardless of any setting of the DSP. And I think I know why. My excellent external speaker already have such an efficient way of reducing noise and enhance voices that the DSP cannot improve anything to it. But the function of the automatic notch filter are really helpful and that alone makes the DSP worth having.

George,

I purchased a mono to stereo adapter and connect the speakers to the jack through that. My receiver volume control works just fine throught the amplified speakers. Perhaps it might have something to do with the mono jack / stereo plug configuration? It might change if you used the adapter - well, I'm just speculating here.

Edwin

George,

Further with your amplifed speaker problem. Did you have the same effect when it was connected to the speaker line out? I have my speakers connected to speaker out and it is fine as I said previously. My Record jack is attached to either a tape recorder or the computer line in,if I'm using any PC based decoders. It's a good arrangment.

Edwin

I stuck the tape to the underside of the DSP then carefully placed
the unit where it goes (not THAT critical) and stuck it to the
chassis. As long as it ends up under the shield plate...

2042. Re: [icomr75] Question

Yahoo group: icomr75 (2000 — 2002)
Date: 2002-07-18 19:55:56 UTC
From: Moxie3
Topic: 1963 Message: 2042

No, didn't try the speaker output jack, just the rec output. I thought that amplified speakers were supposed to be connected to the "rec" connection so I didn't try the "speaker" connection. I didn't want to hurt anything, if that is possible.

George,

Further with your amplifed speaker problem. Did you have the same effect when it was connected to the speaker line out? I have my speakers connected to speaker out and it is fine as I said previously. My Record jack is attached to either a tape recorder or the computer line in,if I'm using any PC based decoders. It's a good arrangment.

Edwin

Subject: [icomr75] Re: UT-106 Installation

I don't remember the installation being tricky in any way. I could only stick the card to one place using the velcro tape, if the cabling would be routed the most logical way. That leather pouch could not be used and the instruction specifically informs that it is solely for protecting when installing in one of the units which I belive where the PCR1000.

Most people seem to praise it's noise reducing capability, but I find it useless as the amount of noise reduction are exactly linked with the amount of distorsion added to the voice audio. I´ve never found the NR to make any voices step out of the noise and make them more intelligable regardless of any setting of the DSP. And I think I know why. My excellent external speaker already have such an efficient way of reducing noise and enhance voices that the DSP cannot improve anything to it. But the function of the automatic notch filter are really helpful and that alone makes the DSP worth having.

Ubbe.

Jim,

I had to read the instructions in our manual and look at the diagrams shown in the instructions. I may have to remove the insulating cover and use the tape. Do you remember where you placed the tape? I can't determine where to place it from the diagram.

Just looked over the instructions again.
It IS pretty vague, isn't it? Hope you got it all figured out and
are enjoying it by now. It CAN make an intelligible signal out of an
otherwise muddy bunch of noise.

It's a Motorola speaker that where used as a hands free LS with
car phones and also for a bunch of different Radius 2-ways mobiles.
You can no longer get it from M as it where cancelled a year or
so back. I managed to get hold of a couple of second hand ones.

I got a bigger M speaker, as well as several different 2-way and
"special" scanner speakers, but no one manage to reduce noise and
enhance voices in such a remarkable way as that small M speaker.

OK, but you have to understand that the ANF wont do anything to
the noise, it's purpose being to notch out a single tone frequency
and not random noise.

Well, I consider unwanted tones as noise also.
They're just not random noises.
Sometimes, what I say and what I mean, are 2 different things ;)

July 19, 2002

Hello to all !

I would like to request the author (Phil) of the cookbook to please kindly add on the last page those "You know you're addicted to R-75" (or something to that effect) quotes that was published long ago in this group. It would be a nice end page for the next version of the very much helpfull & informative cookbook. I wasn't able to copy those quotes when it was posted and I don't have time to search for it anymore but I believe it was also Phil who wrote them and some other members also added there own words.

That's all

Standing by...

Dennis Ls M Cruz (stclaire@...)

Only on SSB you say. The UT106 are connected in the demodulated audio after all the RF and IF circuits so it should process all audio that comes out the speaker regardless of modulation mode.

OK, but you have to understand that the ANF wont do anything to
the noise, it's purpose being to notch out a single tone frequency
and not random noise.

Don't know but that's what the manual states on page 20: "The auto notch functions in SSB mode only." But....I don't know what the heck it is anyway. Maybe when I start using SSB I'll learn.

Only on SSB you say. The UT106 are connected in the demodulated audio after all the RF and IF circuits so it should process all audio that comes out the speaker regardless of modulation mode.

Yep, and only on SSB. I haven't elevated my listening to SSB yet as I'm not sure what is on there. I've been listening only to AM shortwave.

Perhaps the manual should have said that the auto notch is most useful
in SSB mode. You certainly wouldn't use it in CW mode but it can be
used in AM mode.

What it does is this: If there is a hetrodyne -- a sharp tone caused by
the carrier of a station on a close frequency, the filter will remove it.
The reason it is called a "notch" is because if you graphed out the audio
response of the receiver there would be a dead spot -- a notch -- right
where that tone is.

Now, you can use the notch filter in AM. To demonstrate this to yourself,
tune in WWV (5, 10, 15 MHz -- pick the best one). Note that it has a tone
broadcast along with the time "ticks" -- because the auto notch filter looks
for a constant tone, it will filter the tone out. When you turn the ANF on,
the tone will, after a couple seconds, drop dramatically in strength.

This demonstration shows an unfortunate side effect of letting the ANF
do things automatically; WWV would not be a place where you'd want an
ANF. But the demo will show it at work.

Now the reason the manual says that ANF is good for SSB only is because,
well, CW (morse code) will be heard by you as a tone on one frequency
turning on and off... and the ANF will dutifully kill it for you. On SSB,
because of the way the signal is demodulated, is much more prone to
interference from nearby stations, be they AM or CW. BUT, the ANF will
work on AM signals. It's just not as "necessary" there.

Hope this rambling helps.

Eric

From: Jack
Topic: 2057 Message: 2057

Hi all,

I was just wondering if an Inverted L can be laid on its side instead of being actually inverted? ie. the L is horizontal from its first securing to the second then where it would normally come down verticaly keep it going horizontally to another securing and feeding it from that end with a 9:1 balun??

Also with my inverted V could i have multiple antenna's coming off each side of my balun (1:1) cut to different frequencys? ,would it degrade its performance at all? ,improve it??

I would appreciate some advice on the above! :)

Jack.

>
>George

Perhaps the manual should have said that the auto notch is most useful
in SSB mode. You certainly wouldn't use it in CW mode but it can be
used in AM mode.

What it does is this: If there is a hetrodyne -- a sharp tone caused by
the carrier of a station on a close frequency, the filter will remove it.
The reason it is called a "notch" is because if you graphed out the audio
response of the receiver there would be a dead spot -- a notch -- right
where that tone is.

Now, you can use the notch filter in AM. To demonstrate this to yourself,
tune in WWV (5, 10, 15 MHz -- pick the best one). Note that it has a tone
broadcast along with the time "ticks" -- because the auto notch filter looks
for a constant tone, it will filter the tone out. When you turn the ANF on,
the tone will, after a couple seconds, drop dramatically in strength.

This demonstration shows an unfortunate side effect of letting the ANF
do things automatically; WWV would not be a place where you'd want an
ANF. But the demo will show it at work.

Now the reason the manual says that ANF is good for SSB only is because,
well, CW (morse code) will be heard by you as a tone on one frequency
turning on and off... and the ANF will dutifully kill it for you. On SSB,
because of the way the signal is demodulated, is much more prone to
interference from nearby stations, be they AM or CW. BUT, the ANF will
work on AM signals. It's just not as "necessary" there.

Hope this rambling helps.

Eric

The ANF does in fact function in AM mode as Eric stated. It also functions in FM mode but, you aren't going to hear hetrodynes in that mode so there is no reason to use it there. When my local cops transmit their station ID in morse, it knocks it way down as with the WWV test Eric mentioned.

I tend to agree with the distortion part. I hate listening
to a digitally processed signal as it really sounds unnatural.
But for the notch and noise suppression (mainly noise
from lightning crashes) the UT-106 works well.

I had an NIR-12 DSP Reducer and the Notch on it
was superb. However, it did add the funny echo like
artifacts if the DSP control was adjusted too high. Its
no longer made and I ended up selling it.

The UT-106 would rate maybe a seven in relative
performance to it. Then again this was a seperate box
costing over $300 US.

I have an IC-746 with IF DSP and it does seem to
remove the noise more effectively with less distortion.
But , it's not an R75!

A few years back I tested a SB16 soundcard program for PC DOS mode only, and that software where really amazing! It had a lot of filtering options for CW use but also had a compressor/AGC function as well as noise reduction.

It had the same effect as with your DSP, that it added echo if you went too far with the amount of noise supression selected. But the good thing about it where that moderatly set it actually made a dramatic reduction of the noise while keeping the voice sounding human without adding any digital Dalek type of sound.

I think it where moderatly priced at $25 or something and the demo run long enough to have time to evaluate it properly. The UT106 is something like $100, (yes, I had to pay the full amount for mine) and still doesn't come near in performance, but then it can't match the power of a PC and a dedicated soundcard, not to mention the genius of a true soundblaster hacker. The snag was that you had to dedicate a whole PC for doing only a DSP function.

Hi Jack,
Longwire : Balun 9:1 + coaxial RG58 download to rx.
Inverted V: download with open wire (maybe.. flat TV cable) + balun 4:1 in the base of the mast and RG58 to rx.
The rx it should always be with a connection to ground.

More in:
http://arieldx.tripod.com/estaciondx/proyectos/endfeedinvertedv.htm

2066. Kiwa VS Non Kiwa R75

Yahoo group: icomr75 (2000 — 2002)
Date: 2002-07-20 18:08:50 UTC
From: DeWayne
Topic: 2066 Message: 2066

I would like to hear some fresh opinions. Are the Kiwa mods worth the $$$?
Is FM still useable? My R75 does not have the Kiwa mods (yet). Thanks!

DeWayne KE9K

>>

First, the fm is still useable, but sounds a little pinched with the 6 kc filter. But, I don't use fm. This receiver has the dsp.

I recently acquired a used Kiwa modified R-75.

I have owned a R8B for a couple of years.

I use a RCA XTS50AV speaker with the R-75.

I use a modified Hammarlund S-200 speaker with an 8" round duo-cone speaker mounted in it for the R8B.

In extensive side by side tests, the R-75 holds its own in many circumstances.

But, the R8B is a better receiver.

Prior to purchasing this R-75, a friend brought his stock R-75 over and we tried that and my R8B side by side.

I wouldn't own a stock R-75, because it sucked.

I haven't had to modify my R8B.

Then, why did I purchase this R-75?

Strictly price, and it only had to serve a single purpose, in my workshop.

Topic: 2068 Message: 2068

Has anyone any data on actual measured threshold knee, attack, and release times on the R75's AGC?

TIA,

dt

2069. R-75 with mods vrs R8B

Yahoo group: icomr75 (2000 — 2002)
Date: 2002-07-21 12:50:39 UTC
From: atagrasin
Topic: 2069 Message: 2069

The Drake R8B is a good receiver but not better than my mod R-75.In a side by side test: 1.The R8B
Drift by 50 hz or so even after warmup hours
later.
2.A lot of "Birdies" just above most x.5 points in R8B.
3.The R8B run very hot.I turn off the unit but the the power supply inside the unit keep generating a lot of heat.[No good for sensitive electronic component]A lot of R8B owners are using a external power supply
now.
4.In sensitivity the R-75 win hands down in the side by side test.I have the sensitivity mod[the improved one] from the files of this group.
5. The ultimate selectivity filters skirt of the R8B no razor sharp.The R8B use simple LC filtering.The old drake R-7 haved better use better filters.
6.R-75 Dynamic range surpass the R8B.
7.R8B have a 10 years old circuit with some improvements.
8.R8B bassy sound,no good for dxing[You need an external speaker]The R75 too need an external speaker.
9.Passband usable tunning sweep in the R8B unnecessarily narrow and thus fussier to adjust.
10.R8B mechanical encoder give some problems.The early encoder in the first R8 series was better.
Final commentaries:The R75 have 1hz tunning steps,2 pre-amps,tunning range up to 60Mhz,DSP,ANF,TWIN PBT,All for only $600.00,the Drake $1,379 You save about $700.00.The sync det problem can be fix with less than $10.00 if you have solder skills.If you want a better AGC install a $1.00 dollar 220uf cap in pin 4 of the Sync det IC.After the test I sold my R-8B and keep the R-75.

Never noticed that in my R8B..what are you using for a frequency standard to determine the drift?

2.A lot of "Birdies" just above most x.5 points in R8B.
3. TheR8B run very hot.I turn off the unit but the the power supply inside the unit keep generating a lot of heat.[No good for sensitive electronic component]A lot of R8B owners are using a external power supply
now.

Hmmmm, I believe that the R-75 has an external supply also. Right? FWIW, I have used an external dc power supply for years with many, many receivers. What's the big deal about that?

4.In sensitivity the R-75 win hands down in the side by side test.I have the sensitivity mod[the improved one] from the files of this group.

The other evening, I was listening to an amateur group on 80 meters, couldn't make them out on the R-75, used no. 1 pre amp, just increased the noise level. The R8B heard them just fine with no pre amp. What did you use to determine the sensitivity kenneth? What signal generator, output meter or did you use a vtvm or vom? Inquiring minds want to know?

5. The ultimate selectivity filters skirt of the R8B no razor sharp.The R8B use simple LC filtering.The old drake R-7 haved better use better filters.

And, the shape factors on the R-75 are.......???

6.R-75 Dynamic range surpass the R8B.

Proof please, not just a statement.

7.R8B have a 10 years old circuit with some improvements.

And, the R-75 chip is how old??

8.R8B bassy sound,no good for dxing[You need an external speaker]The R75 too need an external speaker.

I don't believe that anyone is dx'ing without an external speaker.

9.Passband usable tunning sweep in the R8B unnecessarily narrow and
thus fussier to adjust.

That is pure bs, the passband shift is nowhere as good on the R-75.

10.R8B mechanical encoder give some problems.The early encoder in the
first R8 series was better.

Hmmmmmm, and you source of information is?? I've owned my R8B for over two
years, not one problem.

Final commentaries:The R75 have 1hz tunning steps,2 pre-amps,tunning
range up to 60Mhz,DSP,ANF,TWIN PBT,All for only $600.00,the Drake
$1,379 You save about $700.00.

When I bought mine, it was $1,159.95.

The sync det problem can be fix with
less than $10.00 if you have solder skills.If you want a better AGC
install a $1.00 dollar 220uf cap in pin 4 of the Sync det IC.After
the test I sold my R-8B and keep the R-75.

>>

Good for you "King of Trolls"....maybe one day I can post something in here
or over in rrs and get good feedback and positive criticism. Not just your
rants about the R-75 is the greatest receiver ever built. A gentleman asked
what the differences were between the stock R-75 and a Kiwa modified R-75, I
gave my opinion. The you come in and tell everyone what is wrong (inyour
opinion) with the R8B. Since you have never (admitted by you) had a stock
R-75 and a Kiwa modified R-75 to compare, I would suggest you take tour
fractured syntax and put it where the sun doesn't shine......example: "Les
wroted"
I got a belly laugh out of that one, I have never "wroted" anything in my
life.

2071. Directional Attributes Of Dipoles & Longwires

Yahoo group: icomr75 (2000 — 2002)
Date: 2002-07-21 15:34:55 UTC
From: Moxie3
Topic: 2071 Message: 2071

I've read shortwave signals are directional, meaning that if I install a horizontal antenna north to south, I would receive signals from the east and west since signals are horizontally polarized when they leave the transmitter. However, I have also read that after signals travel thousands of miles they become horizontal and vertical. Based upon the direction of your antenna, do you feel your reception is coming from all directions or is bi-directional? Also, at what height is your antenna?

George

You must have a "special" white paper, my R8B White Paper says no such
thing about drift.

No, I "already had it"...., the other Jap receivers ran cooler with a
dc power supply, including the high priced NRD series.

I didn't claim to have sensitivity figures. You are quoting from some
obscure article that you fail to mention. When I still had a shop full
of laboratory grade test equipment, I had a HP8640B, HP400B, HP410
that were all NIST calibrated. The wild claims that you make regarding
the R-75 sensitivity would put the mds well below the noise floor. So,
what good is that sort of sensitivity? Invalid argument by you once
again.

Are you learning disabled kenneth? I ask you a question and you answer
with a question. What didn't you understand about what kinds of test
equipment you used to arrive at the sensitivity figures?

Are you saying that you have a "White Paper on the R-75"? If so, it is the only one in existence. If you are quoting your white paper on the R8B. there is no reference to filter shape facotrs on pages 12 and 13.

What in hell is dinamic range??? At what point was it measured? 20 khz or 5 khz. Or, are you quoting someone else once again?

> >

Which white paaper are you quoting now, the imaginary R-75 white paper, or a R8B white paper that doesn't jive with the R8B white paper I have?

Let then know about your research.

I'll be sure and do so.

> > 10.R8B mechanical encoder give some problems.The early encoder in

Having owned aR8, R8A aand now a R8B, I haven't noticed any difference in the tuning or the encoders. It may very well have a mechanical encoder...so?

Earth calling kenneth.......what's the frequency kenneth?????

Once again, (for the learning disabled), I think that my R-75 with the Kiwa modifications is a "GOOD RECEIVER"....I've said so in severaal newsgroups. However, a "STOCK" R-75 SUCKS!!! In my opinion.

Bye kenneth, take your baseless arguments elsewhere, I'll not respond to your poor gr

You must have a "special" white paper, my R8B White Paper says no such
thing about drift.

No, I "already had it"...., the other Jap receivers ran cooler with a dc power supply, including the high priced NRD series.

I don't believe we are talking about the Drake R7 are we??? But, you change the subject to take the heat off of you, don't you?

> > determine the sensitivity kenneth? What signal generator, output
> meter or did
> > you use a vtvm or vom? Inquiring minds want to know?
> Tell me first what you use I have an inquiring mind
> too.

I didn't claim to have sensitivity figures. You are quoting from some obscure article that you fail to mention. When I still had a shop full of laboratory grade test equipment, I had a HP8640B, HP400B, HP410 that were all NIST calibrated. The wild claims that you make regarding the R-75 sensitivity would put the mds well below the noise floor. So, what good is that sort of sensitivity? Invalid argument by you once again.

Are you learning disabled kenneth? I ask you a question and you answer with a question. What didn't you understand about what kinds of test equipment you used to arrive at the sensitivity figures?

Are you saying that you have a "White Paper on the R-75"? If so, it is the only one in existence. If you are quoting your white paper on the R8B. there is no reference to filter shape facotrs on pages 12 and 13.

What in hell is dinamic range??? At what point was it measured? 20 khz or 5 khz. Or, are you quoting someone else once again?
> >

Which white paaper are you quoting now, the imaginary R-75 white paper, or a R8B white paper that doesn't jive with the R8B white paper I have?

Let then know about your research.

I'll be sure and do so.

> > 10.R8B mechanical encoder give some problems.The early encoder in

Having owned aR8, R8A aand now a R8B, I haven't noticed any difference in the tuning or the encoders. It may very well have a mechanical

encoder...so?

Earth calling kenneth.......what's the frequency kenneth?????

Once again, (for the learning disabled), I think that my R-75 with the Kiwa modifications is a "GOOD RECEIVER"....I've said so in severaal newsgroups. However, a "STOCK" R-75 SUCKS!!! In my opinion.

Bye kenneth, take your baseless arguments elsewhere, I'll not respond to your poor gr

Well, well, kenneth, you seem once again to write "half truths"

I found a reference to stability on the R8B in my white paper.
However, it is on page 23..To quote...."Stability after 10-second
warmup, receiver tuned to 10Mhz: 50 hz. Is this the 50 hz you refer to
after "warmup hours" (your fractured quote)? Quite a big difference
between 50 hz after hours vs. 10 seconds isn't there?

SNIP

That pretty much says it all for any credibility on your part as far
as I'm concerned.

Now, take your bogus reports and put them where the sun doesn't shine.

And, your fractured syntax als

Was this necessary?

FYI, some of the more "draconian" listowners would boot someone for this alone. While I don't agree, you can certainly see the point when things degenerate to this level.

On topic, you do know that there are multiple versions of the white-papers? So what yours says and what another one says may differ in some areas.

Please, keep it civil.

I'll try, but when dealing with a kenneth, it's hard to do.

There is ONE copy of the R8B white paper. kenneth is the resident troll over here and in rrs.

Fire me if you will, but read kenneths posts also. He is a TROLL!

From: dawntredereding
Topic: 2011 Message: 2081

I guess it's time that I get into this thread too. As we all realize, the speaker selection is quite subjective and also quite dependent on the types of listening that they are used for. I'm not going to support or refute any of the recommendations given, but just add a few of my own observations on communications speakers. I sailed as a ship's RO, spent several years working for ITT/McKay shoreside, and for the bulk of the past 25 years, in and out of land-mobile service.

For the most part, for broadcast program listening or AM communications (civil aviation), sealed, acoustic suspension speakers have always been the speaker of choice in professional console installations and typically around 5". McKay and Raytheon had installed paneled speakers with a cup-type rear enclosure and the speaker either mounted with some sort of grommet spacers or board. The cup usually had some sort of fiberglass or other acoustic insulation inside. Often the speakers would also be spec'd as "response tailored". I've replaced speakers that had what appeared to be rtv or some other type of compound in a ring just around where the speaker coil was attached to the cone. Others were presumably manufactured for a particular response curve. None of these speakers ever had a giant magnet or any other appearance that would lend you to believe that they were otherwise special or hifi. Other then that, maybe just an L pad. Distribution to the ship was usually via a PA amp and wedge type speakers no larger then 8" also with an L pad.

An RO's job was primarly cw or Sitor, so outside of providing a feed for broadcast entertainment from the ship's main receiver(s) there was rare occasions that SSB recovery was needed. SSB was limited to bridge com's from a seperate transceiver. Some ships had independent, high-powered SSB tranmitter/receiver sets for ship to shore telephone correspondence for crew members that were under the auspices of the RO. These were usually full duplex setups that fed a booth or some point where a telephone type remote was often used. Speakers generally associated with these sets were usually the receiver's panel speaker. Nothing special here. On any Mackay 30xx, Harris, Communication Associates,Motorola(yes folks!) or others, I don't believe that I ever seen anything larger then a 3x5 oval speaker. Some of these radios were noted for some of the best and clearest SSB one ever heard.....no amateur radio equipment that I've ever heard even came close. Surprisingly there was nothing special either about the radio's circuitry besides being an order of magnitude simpler then their multiple conversion amateur cousins and slightly wider filters (2.7 to 3kc). Run the output of one of these receivers or transceivers into a larger, acoustical suspension speaker and the inteligibility suffered dramatically. There was often no acoustical

treatment to these speakers except perhaps a grommet on each corner and a heavy chassis that it was mounted on. For any of those interested, when it came to SSB the best sounding shipboard receivers or transceivers known for their audio had to be: Collins 651s1, Sunair GSR/GSB series, and the Motorola Micom hands down. The stations based on the Harris RF230M transceiver and it's bastard receiver sister proved that an american company could make something that sounded horrible and was best suited as a kluge sitor station.

I never ceased to be surprised that many of the old timers loathed the newer console's receivers. I've been on ships that had a shiny new Mcakay or Raytheon console and the RO was still using the old 50's vintage RCA Radiomarine set with it's CR-88 variant receiver for watch. Why? Not because they were reactionary, simply because you could wear a carbon headset by the hour if you had to without fatigue. Try that on a McKay 3020 or other solid state set and you'd crawl the walls. For program listening, there were a few receivers that were considered ideal and all tube!. The Collins 51s1 (only with the optional 5kc filter installed). There was a commercial repackage of this receiver just for this purpose by LTV-Tempco in a rack mount with a BCB converter. Vintage Super Pro's (400 and 600 ugh!), R-390's and Collins 51jx occasionally were on board.

Back to the speakers. I used to have a 2 speaker McKay panel in my rack that I used to think was the best sounding speaker that I used with my R-390A/TMC sideband slicer and later the dreadful R71a of anything else that I tried. It was superb for AM. I had tried several other bookshelf speakers from Olson, Lafayette, and RS that I borrowed or bought.....until one day I read a review about the early PR0-7 from RS. I bought one with full intention of returning it. For AM it was wonderful! Even my R71a sounded barely listenable on AM now. Mushy though for SSB. This seems to support the observation that heavy acoustic suspension speakers are best for AM and no larger then 6". Over the years I've owned a Heath SB102/Yaesu FT107&901/and the Kenwood 930. All the matching speakers were lousy for SSB or AM by comparison to a little reference that I've owned for years. It's nothing more then a cheap,Ten-tec box with a 3x5" oval speaker in it. I found it at a hamfest for $2. Inside, there's nothing special about it except that the front panel is reinforced with what appears to be a piece of 1/8" inch steel plate and the speaker mounted with fiber spacers. There is a small amount of synthetic insulation inside, probably to counter chassis resonances too. There is a passive audio filter made from a wound torroid and a few 'lytics joined as non-polarized caps. I've added a 2 speaker switch for a/b comparisons and a load to the speaker on/off switch. It's a cheap speaker made for the old Dymek DR line, but it has a "sound" for SSB that excells over anything else and coincidently seems to follow the same patterns that the good sounding commercial ssb units use. I once went out to a fishery/salvage that had an aging Northern SSB transceiver for a shore station. That was being replaced with one of Mckay's bridge sets. The dispatcher/office manager who was also a ham demanded that

I wire in his "special speaker" off the Northern that he swore by. It turned out to be a Tentec made product from their original amateur product line. He was an old coot that had a hearing problem and claimed that he had a problem understanding ssb and this speaker that was his own made the difference between understanding a vessel or not. The speaker was near identical to the one that I have, but in a smaller and taller Tentec enclosure. This one also had a neat audio amp with some sort of AGC loop that could be switched in along with cw filter of sorts. I don't know anything about this speaker other then it was very similar to mine externally, but whatever kind of neat AGC it had made the voices sound thick,compressed, and jump out over the noise. This is one speaker that I would like to find out about just to satisfy my curiosity. If anyone knows what it might have been I'd sure like to know.

Some thoughts. Most of the matching speakers that I've owned except the Kenwood had some buzzing resonances that would make AM listening especially annoying. Those of you that have these might want to try going to radioshack and buy a pack of their acoustic insulation and line the insides. Also try weighting them down. Most are so light nowadays made of sheet aluminum. I've always been impressed with the subtle nature of passive filtering over gyrator or DSP especially for removing amp hiss that can drive you batty with headphones on cw. Nowadays, some of the premium speakers from Yaesu,Kenwood,and Icom already have some variation on this at a cost of near $200 USD!. Try buying a few crossover components from a speaker supply place or canibalize a crossover network from a junked speaker. Series inductance makes a simple low pass and series capacitance high pass. Some standard values that you can try are .5mh and 1.5 mh for the coils and a couple of non-polarized lytics about 22 to 47 mf. Also try mixing and matching them till you find the right eq for your speaker. A box with a few dpst switches that you can switch them in or out of series is a neat little project that can be a valuable adjunct to your ut106 dsp for just a few dollars. For FM, I have to agree with an earlier posting about the Motorola metal speakers of the Motrac and T powered lines. They have to be one of the best along with some of the old military GRC type speakers (remove the transformer in some) for the best FM. Other very similar and good ones are early Motorola hammertone gray relics,General Electric's Progress Line, and Mastr Progress line. These aren't unattractive....they're UGLY, but sonicly very good. Again adding a bit of insulation helps too, especially for the squelch thump/ring. Motorla and GE's injection molded speakers from the Micor/Mitrek & Master 11 lines are pretty decent performers too. The powered Motorola ones used in the convertacoms are quite good for a radio with an anemic output, but have a balanced, low level input to deal with.

Sorry this got so long, but hope somebody finds some use in the ramble.

dt

Topic: 2069 Message: 2082

a few comments and some data...

how much does a decent external power supply cost? a cheap DSP (MFJ)
runs $240... these things sometimes make the difference when people
purchase.

PLL stability, tuning steps:
R8B 5 ppm, 10 Hz
R75 1 ppm, 1 Hz

sensitivity (SSB):

R8B < 0.25 uV pre ON
R8B 0.20 uV (as measured by Passport)
R75 0.16 uV pre '1' ON (presumably better with pre '2')

Note: from 0.1 - 1.5 MHz R8B spec is < 1.0 uV
Note: from 1.5 - 5.0 MHz R8B spec is < 0.5 uV
Note: from 0.1 - 1.8 MHz R75 spec is 2.0 uV with pre OFF
Note: modded R75 is presumed to be 0.16 uV on MW with pre '1' ON

shape factors (SSB):

drake shape factors: 1:2.09 to 1:2.92 (via passport)
R75 shape factors: 1:3.33 for 6 kHz, 1:1.70 for 2.5 kHz

the ICOM has optional slots if you want tighter filters... such as
the 2.1 kHz filter for voice offered by InRad with 1:1.5 shape and
>90 dB ultimate rejection... not too shabby for $98.

dynamic range:

i could find no good direct comparison but both are very similiar and
what would be considered 'good' at about 100 dB.

much of the stuff above is a wash. i personally bought an R75 for
many reasons including: its small size, the ability to fully control
via RS232... plus i did not see what i would gain for my usage over
the more expensive units. the R75 is great for SSB: dxing, utilities,
hams, or ECSS broadcast reception.

phil :)

Hi, Group...
I have been a lurker here for some months, but an SWL'er for many years.
What is the prevailing opinion on the relevance of receivers, such as the R75, as we continue, inexorably, into the digital age?
I am seriously considering the purchase of an R-75, together with a decoder, such as the Universal Radio M-7000, but is there any future in such an investment?
My main interests would be CW, RTTY and WEFAX decoding. Would my investment still be operable in, say, 1 year, or 5 years? Or, in this internet, digital, computerized age, would such a combination of equipment (or similar) be outmoded by new technology in the foreseeable future?
Your views, particularly ones that encourage this investment, would be welcome!!
Chris

PLL stability, tuning steps:
R8B 5 ppm, 10 Hz
R75 1 ppm, 1 Hz

sensitivity (SSB):

R8B < 0.25 uV pre ON
R8B 0.20 uV (as measured by Passport)
R75 0.16 uV pre '1' ON (presumably better with pre '2')

Note: from 0.1 - 1.5 MHz R8B spec is < 1.0 uV
Note: from 1.5 - 5.0 MHz R8B spec is < 0.5 uV
Note: from 0.1 - 1.8 MHz R75 spec is 2.0 uV with pre OFF
Note: modded R75 is presumed to be 0.16 uV on MW with pre '1' ON

SNIP>>>>>

No0w, I don't know about your R-75 manual, but mine states......the following
for sensitivity in AM......yes am, not ssb I don't know of many AM BCB Dx'ers
who listen in ssb."0.1 - 1.8 mhz 5.6 uv....That ios PATHETIC sensitivity
Phil!!

I know, there is a MOD...that's what me and kenneth have been debating for
quite some time now. I hardly ever see a R-75 listed on any of the NRC or
IRCA dx logs. But, R8B's are everywhere.

I stated once already that I believed the Kiwa modified R-75 to be a good
receiver. Every time I post that kenneth pops in with his standard cut and
paste rant about R-75 is "more better", etc.

I'm gone, kenneth is a loser. I have better things to do regarding receivers.

phil :)

No, the true heat is inside the R8B. Yes the drake R7 better in some
very important things than the R8B,no my words the white paper review
people write this. .Re-check again your white papers.

Then why are you feeding him ? ;)

<ObR75> What kind of antenna would you recommend for long, medium and
tropical band usage ? My 15 meter, home-brew T2FD works great between
4 and 40 MHz, but below that sensitivity really drops off.

I'm looking for an easy to construct antenna that works well mostly
below 500 kHz (where my T2FD is "deaf") and that doesn't need to be
re-tuned every time I punch a different frequency into my R75 </ObR75>

regards,

Rik

Phil,

Many that DX the AM broadcast bands are using radios with just AM. For example, the GE Superadio and CC Radio. These don't have SSB.

Since most SW radios attenute the broadcast band, unmodified, they are not also the best performers.

A straight AM or AM/FM radio is also cheaper.

Craig

hi Chris:

have you considered using your PC for decoding? just hook the audio out jack into your soundcard's input. my R75 cookbook (located in the files section) goes over the software i use for digital transmissions... lots of freeware/shareware programs exist! i cannot see this stuff changing all that much in the coming years and if it does someone will just release updated software! you cannot go wrong with the R75 for utilities. the R75 is great on SSB and lets face it everything can be received using SSB.

phil :)

None of the pluses you give the R-75 over a R-8B have anything to do with the usual mods. So...a stock R-75 seems to stack up fine with the R-8B, especially given that it is half the price. I guess an unmodified R-75 doesn't "suck" after all like someone recently mentioned here. But then again, I already knew that. As I have said before, a R-75 does not have to be "mod'ed" to be a great receiver.

Regards,
Bob

I had a Drake SW-2 for a couple of years. It uses the same tuning encoder as the R-8B. Mine failed 3 months out of the 1 year warranty period. Cost me over $100 dollars to get fixed including the shipping costs. I have heard from several other SW-2 owners of this same problem, so there is some truth to this statement.

Chris,

I would not let the fact that many utility comms are going digital stop you from buying a R-75. In fact, it reinforces your decision. The R-75 is a great ute receiver. The difference will be, instead of using a hardware decoder like the Universal, you will use a PC. For every digital mode out there, there is software to decode it (except encrypted comms of course.) Best of all, much of the software is freeware or inexpensive shareware. I presume that if and when shortwave broadcast stations start using digital (e.g. DRM) a software decoder will be available for that too. So, get the R-75 and enjoy!

Regards,
Bob

Subject: [icomr75] The Future of DX Utility

Hi, Group...
I have been a lurker here for some months, but an SWL'er for many years.
What is the prevailing opinion on the relevance of receivers, such as the R75, as we continue, inexorably, into the digital age?
I am seriously considering the purchase of an R-75, together with a decoder, such as the Universal Radio M-7000, but is there any future in such an investment?
My main interests would be CW, RTTY and WEFAX decoding. Would my investment still be operable in, say, 1 year, or 5 years? Or, in this internet, digital, computerized age, would such a combination of equipment (or similar) be outmoded by new technology in the foreseeable future?
Your views, particularly ones that encourage this investment, would be welcome!!
Chris

2099. Re: FL-102 for R75

Yahoo group: icomr75 (2000 — 2002)
Date: 2002-07-22 03:35:33 UTC
From: manabu662001
Topic: 2005 Message: 2099

Dear Members,
I found a problem about my FL-102 installed in R75.

The FL-102,which has a center frequency of 9.010MHz. But,
I installed it in pretext of FL-103. The center of FL-103 is
9.0115MHz, so R75 automatically compensates 1.5kHz difference
when FL-103 used as AM-N.
BUT, R75 also compensates 1.5kHz as to my FL-102.
I told a lie to R75, not FL-103, truely FL-102.
But R75 is HONEST.

What is the matter?

On my R75 with FL-102, the center of 9MHz IF is shifted for 1.5kHz
due to the already mentioned compensation.
So, the passband is shifted lower about 1.5kHz. This kills some of
effect of TWIN-PBT.

Collection is possible with manual-calibration of TWIN-PBT, but this
is dreadful.

FL-102 itself is a good filter, but installation to R75 is somewhat
difficult. So, NOT RECOMMENDED.

Sorry, gentlemen.

Manabu Doi,
a SWL in Okayama Japan

People ... please!

The R75 group is moderated unlike RRS. If this discussion continues in the
way it is I will ban the "discussers".

It is in no way helpful or entertaining to most of the list members.

Please, be polite.

Rado

One of trhe best and cheap decoders is Radaio Raft (a DOS program)
About Eu 30 , requires external decoder . INterface schematics included in
the help files.

Another great RTTY decoding software is True TTY (www.dxsoft.com)
operating under Windows . It gives the best results even under relatively
diverse condintions. You must have soundcard to perate it .

On 21 Jul 2002 at 22:55, you wrote:

From: philberttroy
Topic: 2105 Message: 2105

The lottery here in washington state is now climbing to 30 mega
bucks so I thought I might share my plans after I win with the rest
of the group.
I plan on sending plane tickets to RADO and PHIL and BOB.
Then I shall proceed to convene a super dx symposium with these guys
and CRAIG from KIWA.
Almost forgot....MR SHERWOOD would need to be here too to make sure
all the se-3s were hooked up and working correctly.
During this two day period I will get their help in installing my
new TEN-TEC 340's.....and ICOM 9000's.
I will also be putting in 4 more ic-r75s in every room....fully
modified of course.
Then we will all move to the roof to install a battery of various
antennas including my new phased array system.
The second day will be for writing and installing new digital
cracking software and radio control options.
Then I will compensate these men with generous ammounts of cash and
send them on their way with my thanks.
With this super shack system in place and functioning I will never
miss my favorite programs on shortwave again regardless of
conditions.........DR Gene Scott and the continuous opera from the
RADIO FREE ASIA jammers........hahahahahaha.
You people will notice that I refrained from including any mention
of my new female knob twiddling assistants in the previous discourse.
hahaha
I just thought the time was right for a bit of humor in this group.
thanks for your time
Phil

2107. Re: The Speaker Subject & Other thoughts on the subject (Longer :o)

Yahoo group: icomr75 (2000 — 2002)
Date: 2002-07-22 21:20:38 UTC
From: radiohighfreq
Topic: 2011 Message: 2107

DT,

Well written and detailed.
What more could I add...
But, I Will :o)
.
It is my understanding there are two major types of speakers:
* High Efficiency Speakers Circa (1920 to date).
+ Good Audio Quality at normal listening levels.
+ Reasonable Dynamic Range.
+ Relativity Low Power Input Requirements.
+ Highly durable and easily maintained.
- - - vice - - -
* Low Efficiency Speakers Circa (1960 to date).
+ Superior Audio Quality at high listening levels.
+ Extended Dynamic Range (Lower Lows & Higher Highs).
+ Higher Power Input Requirements for normal listening levels.
.
Most, military, industrial and communications gear use:
+ Well designed Audio Amplifier Circuits that average 3.5 watts and do not exceed 5 watts.
+ These circuits are functional and efficient.
+ These circuits are designed to drive high efficiency speakers.
- When a Low Efficiency Speaker is connected to one of these 3.5 watt amplifiers the amplifier has only marginal power to drive a 20-50 watt nominally rate speaker that may have a peak rating of 50-100 watts. Note: Trying to do so at maximum output for extended periods of time may cause damage to the audio amplifier circuit.
.
Most quality consumer audiophile gear use:
+ Very well designed Audio Amplifier Circuits that average 50 watts per channel and offend exceed
150 watts.
+ These circuits are exceedingly functional and very in-efficient.
+ These circuits are designed to drive low efficiency speakers at very high sound levels near maximum power.
- When a Low Efficiency Speaker is connected to one of these 50 watt amplifiers and the amplifier is turned up to the maximum; you Blow Out the Speaker. Note: The audio amplifier circuit usually is not harmed.
.
You bring up a good point about the cup back speakers and well designed simple speaker enclosures that are solidly built. If you look at the old european designed and manufactured table radios by Grundig and others. You find specific low efficiency speakers for

high and low tones (sometimes several) with cup-backs; cross over
circuits placed in solidly built radio cases. These are the radios
that most people remember and praise for the quality and depth of
there sound.
.
Your advise on how to improve the average 'matching speaker' that is
marketed as an accessory for most consumer grade radio gear is worth
noting and acting on. My Kenwood SP-430 is basically a 3.5" high
efficiency speaker in a hollow tin box that 'matches' my R-5000. But
is it worth the $100 to $150 that most manufactures charge for a
'matching' speaker with a Brand Name on it?
.
Back to My Hunt for one of the old Grove Speakers on eBay. These
"Reportedly" were Top Rated as a Communications Speaker: Speaker;
Enclosure and Filters. They were discontinued and use to be in Texas
of all places. Last one I saw on eBay bid out for $200+.
.
well that's my double nickels worth ~ RHF

2108. A Wonder Forum to "Sing the Praises" of the Icom IC-R75

Yahoo group: icomr75 (2000 — 2002)
Date: 2002-07-22 22:17:37 UTC
From: radiohighfreq
Topic: 2108 Message: 2108

This is a Wonder Forum to "Sing the Praises" of the Icom IC-R75 and share our personal and collective experiences in dealing with the R75's shortcomings and faults.

.

The "Tone" of this eGroup should be generally Positive with respect to the R75.

.

Individuals should not be 'Attacked', 'Denigrated' and 'Bullied' - Period.

.

The Term "JAP" along with other words to many Asians is just like the "N" Word; and simple should not be used in a "Public Forum" like a Yahoo eGroup.

For those Who are Interested and Wish to "Sing the Praises of the Drake R8". There is a Yahoo eGroup that is 'Dedicated' to the 'Amazing' RL Drake R8 Series Receivers. All Versions!

.

eGroup Name: "draker8"

.

Focus: Drake R8 Shortwave Receiver Group

.

Link: http://groups.yahoo.com/group/draker8/

Gee, where's my cut?

73,

Mark J. Fine / mark.fine@f...
Remington, Virginia, USA

Saving the best for last of course.....all fine tuning would be left to the venerable Mark J. Fine.

(Hey Mark I think I still owe you for that 8500 program...send me an e-mail on that. I will also owe you for that cheeseburger I ate last Tuesday...hahaha)

Anyone hearing anything exotic lately???
I have some pretty bad noise levels up here.....to the point that the discone actually does better than the wires.

Appreciate it if any of you gentlemen and ladies would share a quick log for compairison purposes only, not to be retransmitted without the express written consent of the commisioner Sir Rado.

Phil

Same here (Curitiba, south of Brazil). I'm using a 15 meter
home-brew T2FD.

A few months ago (before I had my R75) I used to listen to
various weak stations on the 90 meter band, now I'm lucky
to hear Radio Sonder Grense on 3320 kHz!

Pretty frustrating when you keep into account that my old
radio is a Sony 7600G and the R75 is now receiving less
stations...

OTOH, I _am_ able to listen to Radio Cacique on 2470.9 kHz.

regards,

Rik

That Grove speaker that you're inquiring about, was it called the SP-200(x) Ca.~1990 ? Was this Bob Grove's speaker that a built in audio amp,audio filter,tape recorder activator,and squelch circuit in a walnut enclosure?

Re: the audio amp stages in mil/commercial hf receivers. I don't believe that the most powerful spec'd amp that I ever seen in a Transceiver/receiver was more then 5 watts. The only reason for that power level was the amp's were alternately used for intercom and provided audio between the main unit and a remote(s). Typically most were no more then 3 watts. Despite the availability of audio IC's, virtually every manufactuer besides Sunair had a discrete push-pull comp/sym amp that I ever worked on. I got thinking today about some of the major differences between design topologies between commerical and amateur products and it would be an interesting post if anyone might be interested.

From: Art Burke
Topic: 2011 Message: 2115

Hi Guys:

I sent my radio to Icom twice, and discovered that I had a bad power supply all along.
Even though it read 18.6 volts, it must have dropped when plugged into the radio.
I also discovered that the "red" and "black" connectors on the back are for the antenna and not
power..:(

Art
Thanks ICOM!

> sound.
> .

Thank you for the posting the link RHF. I'm wondering right now how I can very nicely and politely tell you not to waste you time or money pursuing the SP-200. It is NOT the ultimate communication speaker by a long shot, but more an accessory for a scanner or shortwave portable such as the Sony ICF-2010 or Sangean 803. The construction of the unit nothing but a U shaped painted piece of sheet metal covered with a very poorly finished U shaped wood cover. The speaker itself is an inexpensive 4" round unit that has a very small magnet made by Speco with no form of acoustical treatment...simply bolted on the four corners with a plastic grill similar to the type you would find for automotive sound. Now what does it really do? To begin with it's built around a little LM 38x 2 watt ic with a treble and bass control circuit that's very similar to some of the data sheet circuits. There is a noise limiter on board too. This is a variation of the old AM ANL diode clipper using two op amps. If you remember how badly the old cb's sounded with the switch on, this version takes it to lower depths. It's absolutely unusable and there's dramatic distortion even with the control just swithced on and not even rotated enough to bias the clipping diodes significantly. Now the squelch. You would be lead to believe that you're getting some sort of voice/syllabic squelch from the ad copy. Syllabic squelches are very complex circuits.....not this one. You're getting essentially a op-amp vox circuit that's really there to activate the recorder relay. It will work adequately on a relatively free noiseless circuit. If you had a scanner with a broken squelch for example. It's also very fussy to set up, because you have to have the input volume set just right to "flash" a peak indicator on voice peaks. This is just not going to work on HF. This circuit drives a relay driver and output attenuator for a tape recorder. This whole circuit is just a variation of the little scanner recorder boxes that's also can mute the input to the internal audio amp. This leaves the audio filter. It's a classic and simple implimentation of the gyrator audio filter that you can either peak or notch. It's not bad either,but nothing that you wouldn't be able to buy in a $20 or less kit. The headphone jack does not disconnect the speaker, but requires a toggle switch to kill the speaker. This circuit too has a problem. The switch just opens the output to the speaker. Assuming you don't have headphones connected and are using the box for recording scanner traffic which is a very real possibility....that audio chip is driving an open load unless you turn down the audio gain. A simple load on the other side

of the switch would have been trivial to add.

So we have some mediocre scanner accessories all rolled into one box with a cheap speaker. Still it's a good idea anyways and the integration is very welcome to anybody's setup without wires all over the place. There's a fixed cord that has a mini phone jack which plugs into your speaker and a wall wart that powers the box. How does it work?

You guessed it...mediocre to poor. The whole chassis buzzes with very little drive on almost any program material...were not talking about even turning this thing on yet. Turning on the volume control, you're first met with a very noticable hiss....if you think that's bad, boy are ready for the best part. Engage any of the functions such as the filter ....MEGAHISS!!! This is partially due to the high gain of some of the devices spread over two circuit boards. The front panel has a circuit board that contains all of the switches and pots. That's cabled to the amp/signal processing circuits on another board that's mounted below. All that open foil track and ribbon cable presents a lot of long in and out unshielded paths between many high gain IC's. This is not good!

What to praise? Unfortunately from the bottom-line, this box doesn't fulfill the requirements for a good communications speaker.It was grossly overpriced, the accessories are basically scanner oriented and engaging most functions overwhelms you with even more hiss. This speaker just doesn't cut it for shortwave listenting and is more of a shelf dressing for the impressionable. Lots of knobs and switches with a few blinking lights, but no substance for $250. Out of a 5 being the highest, I'd rate it a 2. There is no real difference between the letter revisions..they aren't even marked on the chassis. Main difference is that one was discrete circuitry, followed by a SMT version. There was also some mods that cleaned up a ground loop problem and a slight re-wiring of the recorder activator. Now for the Kudos. Whoever designed this deserves a cookie! They solved a problem that has vexed anyone trying to integrate a bunch of audio ancillaries short of using a huge, multi-wafered/stacked switch,super custom relay or patch bay. This was no easy feat and it was solved by brilliance. To manage all of the inter switching of signals and control by mechanical means would have cost a bundle. The answer? They used 2 analog multiline mux/demux chips (4052 and a 4053) to handle all of the signal/control routing. Elegant soloution to a very expensive problem to implement.

As the saying goes, All sizzle, no steak.

I'm sorry if this review dampened your hopes. Perhaps a discussion about what we would really want in a good station console/speaker would be good topic here. I'm game

Topic: 2117 Message: 2117

Has anyone had any experiences with connecting a long wire feed connection at the end or middle? I ask because I read some instructions to attach the feed at the end. But then, I think I remember someone saying to connect at the middle. In my case, it would be much more direct if I make my feed line connection at about the center of the antenna wire rather than the end but I'm concerned about performance. Any thoughts?

George

Hi, George,

Sorry I didn't get back to you on this earlier.

There are antenna types that consist of horizontal wires tapped at
the middle or slightly offset, but they aren't random-wires and don't
work the same way.

Your best bet is to tap at the end.

And your other question, which you didn't ask here, is that, yes,
it's okay if your random wire wanders around, even in the shape of
a (large) U. I got great results as a kid using a wire run roughly
in the shape of a coathanger.

The thing about random-wire antennas is that they are rarely pretty
but they usually do a decent enough job. I still use random wires,
although I want to get a T2FD up some day. (Okay, what I really
want is an FAA/FEMA LPDA, but I digress...)

I have 2 60ft long antennas. One I use outside with my DX398. I have experimented with various feed connect points and have found that it works best connected at the Southern end of the wire. Why the sourthern end, is beyond me. My signal strength is noticeably weaker when connected in the middle. The middle IS incidently where I hook my VR500, as it tends to overload if connected at the end.
Hope this helps...

Eric, thought you took a vacation. If a large "U" is ok, should the two parallel wires be separated by a minimum distance? My wires (which would be the sides of the "U" shape) would be separated by about 15 feet; someone mentioned that a parallel wire may cancel out signals - what do you think? As that saying goes, the more I know, the more I realize I don't know.

Oh yes, is it OK to connect a bare antenna wire with an insulated antenna wire or should the wire be consistent?

> power..:(

Well, you must have been in a hurry. The second trip to Icom was after this "discovery"? What was the damage? I suspect the matching transformer for the high impedance antenna input evaporated.

Regards,

Rado

Vacation, hell, *very* close wildfire and ARES callout. Wasn't
worried about the house -- the fire would've had to cross a lake --
but I had to get the pets boarded because the smoke was so thick.

> If a large "U" is ok, should the two parallel wires be separated by a
> minimum distance?

Well, in theory and in *some* practice, yes. You wouldn't want to
run them, say, a foot apart.

Someone may blast me on this, but I think you'll be okay. Farther apart
is better, but when you are receiving a signal by skywave, as shortwave
broadcasters will be, the polarization and phase will be all over the
place. Wavelenghts shorter than 15 feet (about 60 MHz -- above the short-
wave bands) wouldn't be interfered with, but shortwave signals can be
interfered with. However, with all the multipath going on, I don't
know how much impact the "closeness" would have.

= George =

You may wish to consider these 'limited space' and 'limited support
point' antennas that Put More Wire In the Air.
Omni -v- Directional Performance varies with height and length of
antenna.
.
#1 Center Point Feed "Point-to-Point"
Dual Random Wire Antenna
Common Feed Point (@)
Common End Point (+)
Feed Point (FP) should be 20 Ft or higher.
End Point (EP) should be 50 Ft or more.
Top: Horizontal (H) Random Wire
Bottom: Slopper (S) Random Wire
FP H-EP
@ * * * * * * +
*
*
*
*
*
*
+
S-EP

#2 End Feed Point
"Out-Down-Return" (Open Triangle)
Folded Random Wire Antenna
Feed Point (FP) should be 20 Ft or higher.
End Point (EP) should be 50 Ft or more.
Out/Top: Horizontal Leg
Down/Back: Vertical Leg
Return/Bottom: Slopper Leg
The Return End (+) is NOT Connected

The Gap between the Feed Point
and the Slopper End Point is 5-6 Ft.
Use nylon rope to bridge the gap.

2128. Untold Icom option??

Yahoo group: icomr75 (2000 — 2002)
Date: 2002-07-24 07:15:08 UTC
From: Jack
Topic: 2128 Message: 2128

Hi all,

I was just re entering frequencies into my R75 after a CPU reset and decided to do it via my computer to save my fingers and make it easier!
I use Smart Icom Control by Mark J Fine and i have just discovered that there is an extra AGC Setting!! ,as far as i can work out it is not accessable via the actual radio but through the computer control program there are 4 settings ,OFF ,SLOW ,FAST and another one called S-FAST (maybe super fast?) ,and you can actauuly here the difference while switching from fast to s-fast and then off...its made 1 hell of an improvement to weak stations and i was wondering how many other users knew this or am i the first to bring it to everyone's attention??

I did some extensive tests this afternoon using fast ,s-fast and off and i find s-fast to be a great setting ,its really an improvement in picking out weak and fading signals ,1 thing i did notice is that when engaging s-fast the display does not indicate its use at all ,instead it just flashes f.agc instead of it being solidly lit?

The only way to be able to use this extra setting so far is via the computer ,as once you turn of the unit it seems to revert back to its 3 settings ,i am trying some more experiments to see if there is away of retaining the s-fast settings ,i will keep all updated!

One question i would like to ask though as i dont very often hook my R75 to my computer is that with fiding this extra setting and using it can it actually in anyway damage or hurt the unit seen as it wasnt an option with the radio on its own?

Any comments appreciated!

Regards,

Jack

Hello!

I guess it is a special function for high-speed scannning, mailny
provided for spectrum display oriented by IC-R8500.
I am very interested in the way to activate s-fast AGC in normal
operation without computer.
But I don't know, so I use AGC-OFF position with control of RF-Gain.
This is an alternative, but really clumsy.

Manabu Doi, a SWL in Okayama Japan

Hi,

Well i tried to save it to memory with a frequency ,turned off the unit ,turned it back on and it was still there...thought great i have worked it out!...but as soon as you change the AGC to any other setting the f-agc setting is lost no matter what was saved in memory and the memeory channel resorts back to the fast AGC setting and you have to once again set it via the PC! ,so unless you want to keep all memorys on f-agc for good i havent as yet found any other way of retaining the setting....but ill keep experimenting!

Maybe there might be a internal modification to allow it to work from the radio or make it stay on after being set by the PC?? ,i guess someone with knowledge of the internal workings of the unit maybe able to shed some light or help on the matter??

Here's hoping.....

Regards,

Jack.

2133. Re: [icomr75] Longwire Feed:Connection: End or Middle?

Yahoo group: icomr75 (2000 — 2002)
Date: 2002-07-24 12:46:21 UTC
From: Todd Gaine
Topic: 2117 Message: 2133

A and B are "measurements", not a return loop. It is a single wire with lead-in (download) connected approx 1/3 along the length.

Todd

2134. RE: [icomr75] Finally, it works!

Yahoo group: icomr75 (2000 — 2002)
Date: 2002-07-24 13:38:31 UTC
From: Art Burke
Topic: 2011 Message: 2134

Hi Rado:

No, everything works fine. I hooked up a loop antenna to it as soon as I received it and
it works like a charm.

I put the DSP unit in it, but don't really know how to work it yet.
Could you help me on it's operation, or where to find instructions?

Thanks,

Art

> the antenna and not
> power..:(

Well, you must have been in a hurry. The second trip to Icom was after this
"discovery"? What was the damage? I suspect the matching transformer for the
high impedance antenna input evaporated.

Regards,

Rado

Could this be ultra-short agc time constant be a function of the scanning? If it's anything like the IC-718, There is a much shorter agc time constant that is switched in only during scanning. In that radio, when that time constant is switched in it's called "Reset". I only have a schematic of the R75. The unit shows 4 control switches (transistors Q 1061,1064,1065,1066). Q 1066 is labeled AGRS. Is this the transistor switched in during this "super fast" agc time? It might also be the same one switched in during scanning too. Pin 2 of the device is the control line. Probing this line with a voltmeter under both conditions might confirm this. Just a hypothesis folks.

Thanks a lot, gentle men!

I'm not a technichian, but I'll try.

By the way, I removed FL-102, and installed FL-103 again.
The problem of FL-102 installed in R75 is regrettable, but
good experience for me.

2140. How about CR-282 TCXO?

Yahoo group: icomr75 (2000 — 2002)
Date: 2002-07-25 15:53:46 UTC
From: manabu662001
Topic: 2140 Message: 2140

Dear Members,

I want to know how about CR-282 temperature compensated crystal oscillator.
My questions:
1. How long is the time of warm-up, from cold-start
2. How about the effect, not only as a measurement but bodily sensation.
3. Does the crystal improve the absolute accuracy of frequency, or not?
My target is neither RTTY nor FAX station, but BC station distributed on tropical-band spectrum.
I receive them via ECSS technique, USB/LSB.(Called □gbeat zero□h in Japan)
I also own IC-R9000 equipped with TCXO(0.25ppm). R9000 needs more than 60 seconds to warm up its oven. Its stability is satisfactory, so called □grock-solid□h after warming up. But R9000□fs finest resolution is limited to only 10Hz. This is adequate, but sometimes clumsy. R9000 is never suitable for mobile operation because of its heavy power consumption. Above all, he is too big, NEVER PORTABLE!
Still I employ R75 in mobile operation. IC-R75 excels in resolution, down to nearest 1Hz. R75 is stable enough, but somewhat drifty when 1Hz steps turned on. Especially I notice a little drift when VFO/MEMO mode is changed.
This is annoying during ECSS □gbeat zero□h tuning.
Nervous? I think so, hi! But CR-282 is not so expensive in here Japan, so very fascinating.

The following is loggings of mobile operation in July 23, 2002(July 24 in Japan)
3199.99kHz TWR-Swaziland (presumed) 1948-1955UTC SINPO23332
Informed by Mr.N.Takeno. I thank him.
The audio file is offered in http://mav.nifty.com/ahp/textview.cgi?nodxc+14100+256
This is directly sampled from an internal speaker of R75 by digital device. Using headphones, fidelity is greatly improved.
5100.01kHz Liberian Communications Network (presumed) 2017-2027UTC SINPO22332 with heavy QRM
4814.968kHz R.Difusora de Londrina 2036-2040UTC SINPO23332

Equipments: IC-R75 with AN-1 (mobile operation)

2141. Radio Shack RCA Speaker Returned

Yahoo group: icomr75 (2000 — 2002)
Date: 2002-07-26 02:46:57 UTC
From: Moxie3
Topic: 2141 Message: 2141

Tried the RCA speaker from Radio Shack, item 40-5024 that a few members recommended. After a few days, I decided to return it as I was not happy with the speaker's volume. Seemed like I needed to place my volume control to maximum most of the time to receive reasonable volume, however, sound quality was acceptable. I'm not a technician by any means but maybe the volume problem is caused by it's 20-watt speaker. Most every base station speaker I looked at is rated from 3 to 5 watts. Because of this, I'm thinking that the speaker is not as efficient and thereby requires full power from the receiver's amplifier. Someone in one of the posts advised not using a speaker if you need to place your volume control at maximum for extended periods. Comments anyone?

George

I just now turned my R75 on and did a quick scan of a range I like to check. Pushed the V/M button to put it in memory mode. ALL of a sudden it is only displaying the frequencies. No more alpha tags! Is it in some mode I have forgotten about or did they just magically all go away? I turned it off and back on again to no avail...

Hi dwt,

I tried to access the s-fast AGC option while scanning and it didnt activate ,so i guess its an option that Icom left out and the only way to use it is while its connected to the PC....having said this i wonder what other hidden options would be able to be enabled by software and a PC? ,maybe there are lots more options like this available via PC and software??

Which reminds me i did find another option not accesable via the radio but with the PC and software ,not sure what it does but there is an option of 'Auto Bandwidth' ,i have yet to do a test ,ill get to it now and report my findings back here shortly!

I will still try to find a way of accessing this s-fast option ,if i find out anything else ill be sure to update all :)

Jack.

2148. "hidden functions" on r75

Yahoo group: icomr75 (2000 — 2002)
Date: 2002-07-26 11:12:28 UTC
From: Jem Cullen
Topic: 2148 Message: 2148

Mark J Fine where are you?

You will see the Sfast AGC, and auto bandwidth are both utilized it MJF's Smart R75.(not to be confused with MFJ)

I know the SF_AGC is shown in the manual where it gives the instructions for sending rs232 commands to the rig, cant remember if the Auto bandwidth is.

Hey, Mark Regarding the Smart r75, is there a reason why it sometimes automatically changes my rig to AM -narrow filter when i pick frequencies from the built-in broadcaster database?

just my thoughts

Lurking in the shadows... <G>

> sending rs232 commands to the rig, cant remember if the Auto bandwidth is.

The Auto Bandwidth is something I added via software. What it does is allows you to have preset bandwidths depending upon mode. For example, I usually have 6kHz for AM and 2.3kHz for SSB on my Drake. The other radios don't have an auto-bandwidth feature built in, so I added it via software.

> Hey, Mark Regarding the Smart r75, is there a reason why it sometimes
> automatically changes my rig to AM -narrow filter when i pick frequencies
> from the built-in broadcaster database?

Some of the targets in the database are specially coded, which is why you see ff, cf, rf, uf, or lf, the abbreviations standing for FM, CW, RTTY, USB and LSB FEED, respectively. Anything else is AM, unless the target is blank. Depending upon the target, the program will automatically shift the mode of the receiver. If Auto Bandwidth is on, the bw will shift with it. If the target is left blank, no mode (or auto bw) change occurs.

Realizing that sometimes this is too much of a pain at times (for example, sometimes you just want to tune AM signals in SSB to avoid QRM and not have to keep switching modes back), I'm building in an option to turn this feature off in v4.

Thanks. To be honest, I didn't know it was a hidden feature until people started to mention it. The program was written "in the blind", with some help initially from Tom Sundstrom and later from Mark Veldhuis. They acted as real-time testers, being my eyes (and ears) during program development, finalization and post-deployment testing. I've been planning on getting an R-75 this year but have been putting it off because of other expenses (like getting an XP machine to finally put those silly little XP-related issues to bed).

> Keep up the great work!

Thanks again.

Have an Icom R75 w/DSP, no mods, bought new this year, Icom PS, manual, Phil's cookbook, box, hard to tell from new. I am looking to trade for a Drake R8 or R8A in similar cond. Love those Drakes! Also have for trade a Sony 7600GR w/Sony PS, reel antenna, case, manual, box, excellent cond. Satisfaction guaranteed, have references. Might also consider a Drake SW2 w/remote in similar cond. Not interested in anything with cosmetic flaws. Thanks!
DeWayne KE9K

Dear Members,

Here in Okayama, LRA36 Radio Nacional Arcangel San Gabriel delivers very good signals!
A combination of FL-103&FL-257 is suitable for ECSS reception.
The audio file is offered in the following URL.
http://mav.nifty.com/ahp/textview.cgi?nodxc+14100+258
This was sampled from an external speaker SX-T5 by digital recording device.
I noticed that there are some errors of frequency readout in my R75.
As to my R75, they are approximately +12Hz/5MHz, +24Hz/10MHz, +48Hz/21MHz. But those of R75 are smaller than older R72 or famous TS-690 transceiver. They are over 80Hz/21MHz.
So, I set my R75, for example, 21590.048Hz to tune precisely R.Nederland at 2000UTC.
This is not so serious problem, as long as I remember, hi!

Manabu Doi, a SWL in Okayama Japan

2158. FS: ICOM R-75, EXTERNAL SPEAKER AND TUNER NEW!!!!!!!!!

Yahoo group: icomr75 (2000 — 2002)
Date: 2002-07-28 21:10:34 UTC
From: klodtlarry@aol.com
Topic: 2158 Message: 2158

Hello! Well I hate to say it, but I am going to sell my NEW ICOM R-75. I purchased this unit the last week of May, 2002. This unit has been used for LESS THAN 1 HOUR! It has never been opened nor does it have any mods done for it. It is in NEW OUT OF THE BOX condition! Here is what is included:

ICOM-R-75, Manual, Icom Power Supply, Box, Jensen Bookshelf Speaker (works as good or better than the SP-21) (matches size and color of the R-75), and an MFJ-956 Tuner/Preselector. All of this is only 2 months old and is in NEW condition used less than 1 hour!

This is the best radio I have ever had, and I hate to sell it, but I have found that I do not have the time to put into the SWL hobby that I thought that I do, and I have decided I would rather pursue other hobbies.

I am asking $600.00 INCLUDING INSURED SHIPPING. This outfit cost me in excess of $700 2 months ago. Please email me if interested!

Thank you!

LARRY- KC0HBB

Larry, sorry to hear you're selling your rig. Only had mine for about 2 months, if that, and I too haven't spent as much time with the radio as I had hoped. But I'm still hoping to allocate more time in the future and do enjoy the precious few minutes I get with the unit; it's a nice diversion. Did you ever get the Durham part? If so, how do you like it?

George

I never have ordered it. I was hoping this time around to get into radio again. I just dont have the time. If the outfit does not sell, I will try to devote more time this winter to listening. And to be honost, I bought a Sony XM Satellite radio this spring, and have the home and car kit, and have been bringing the radio inside at night and listening to Art Bell 3 hours earlier than I can listen to him on local radio! I now get sleep at night :-)

From: brother_lloyd_99
Topic: 2161 Message: 2161

A R-75 perhaps?
My Compaq 1200US laptop for a FT-817 or a R-75 or a radio that is equal in
value to:

Laptop has 800mhz Celeron Processor.
10GB hard drive - Partioned in half.
128mb ram
DVD drive
2 USB ports
Came with Windows ME.
I paid about $1100 for the laptop at Staples on New Years Day. Would imagine the market value of about $900.

I will throw in my USB CD burner too. The burner was bought about 2 years
ago. I guess the value of the burner would be about $125 USD
Can run on Win ME or win2000

Will include Netgear card too

I don't use this laptop as much as I thought I would. It's too cumbersome
for me. Plus, I have a old IBM ThinkPad 486 to use anyway.

I would be willing to trade for a HF Rig equal value of about $900-. I
will consider serious inquires for a Yaesu FT-817 with some accessories. Or
a Icom R-75 with some filters. A Kenwood 570S or a FT-100 I will consider
too.

Good offers please.

Let me know

Hi all,

First off where do i lay my hands on the "how to do" for this mod :)

Secondly would there be away of making the mod switchable? ,ie being able to switch it in or out from a switch on the rear panel??

I live about 5 or so km from a local AM station (no idea what power output!) ,it only reads 40+DB with both preamps engaged on the V and fullscale with preamp 1 on the longwire ,but at the present time i have not ever been bothered by it ,i dont get any images/interference ,and so far no birdies come to think of it....anyway i was thinking of doing the MW anttenuator mod ,but i was thinking along the lines of putting in a switch so if i need to i can anttenuate it when ever neccesary.

If anyone can advise on the above i would appreciate it :)

Regards,

Jack

2166. Further to the MW attenuator

Yahoo group: icomr75 (2000 — 2002)
Date: 2002-08-01 08:15:15 UTC
From: Jack
Topic: 2166 Message: 2166

Hi all,

Do you think it would be at all possible to install a variable attenuator on the R75?

I know there would be no way of controlling it via the front panel controls ,but maybe an external setup or a back panel mount? ,the reason i ask is that instead of installing a switchable attenuator ie either on or off ,i think it would be much more 'usable' to have 1 you could variate depending on your needs?? ,im planning on doing the mod but before i do i would like to work out the best method!

Be interested to hear some opinions on this :)

Regards,

Jack

Topic: 2154 Message: 2168

My IC-R75 (w/ high-stability oscillator) frequency readout is extremely accurate and only varies by about 1 hz from MW up to 20 mHz. I have my set calibrated perfectly at 5 mHz and the set is only off -1 hz in the MW band and and +1 hz at 15 mHz. Using a software based spectrum analyzer allows me to quickly and confidently make frequency measurements accurate to 1 hz.

2169. Re: How about CR-282 TCXO?

Topic: 2140 Message: 2169

Manabu,

My IC-R75 is equipped with the TXCO and I am very impressed with the performance. The rig is rock solid stanle within a few minutes from a cold start and drift is non-existent from that point on.

I have also found my R75 to be exteremly accurate across the spectrum covered. I have my set carefully calibrated to be dead on frequency at 5 mHz and is only off -1 hz at MW and +1 hz at 15 mHz. I am unsure if the TXCO itself results in this very high frequency accuracy but I can highly recommend.

The performance of the R75 is very impressive indeed. I am also interested in tropical band freqency distribution and the R75 allows me to take confident frequency measurements to 1 hz throughout the tropical bands. I use a software based spectrum analyzer called Spectrogram to aid in PFM and signal analysis.

That is great news indeed, I look forward to the new release.

Are you familiar with the 'NRD' control software for the NRD-535D? I am wondering if it would be possible for you to tweak the spectrum display function of your R75 Smart control software that would allow the plot to be based on averaged signal strength readings of each sweep, like the NRD software?

Didn't have any previous luck using my amplified speakers connected to the 'REC' jack, as recommended in Phil's R75 Cookbook, so I tried again - and still no luck. I now tried using the speakers in the 'EXT SP' jack and they work great. Is everyone who is using amplified speakers using the 'REC' jack or am I doing something wrong here. Also, is there a problem with using the "EXT SP" jack for amplified speakers?

Yes, I was planning on expanding that feature a bit. The current display shows overlaid actuals, but only shows the average on a refresh. Was thinking about an option to show current, accumulated, and/or average sweep values.

hi George:

if the amplified speakers do not have a volume control then you will probably want to use the 'EXT SP' jack. if they take regular 'line voltage' AND have a volume control then use 'REC'. i will listen in on the responses and make changes in the next cookbook edition if necessary.

regards,
phil :)

i sorta thought the same thing Rik... if the signal gets knocked down too far you can always boost it back up. an external attenuator, or external tuner, or low-pass / high-pass filter are options also, depending on what one wants achieved.

phil :)

K4Ten,
.
Thanks for the tip on the RCA's being on Sale at R/S.
.
Concerning your new 'in the attic' antenna: EMF from nearby
lightening, does not stop at your roof line. A close storm that could
cause damage with an outside antenna may very well cause damage with
an 'in the attic' antenna.

George & Phil,
.
Are both the REC Output Jack and the EXT SP Output Jack: Mono Jacks
that are wire 'mono'.
.
Or, is the REC Output Jack a Mono Jack that is wire 'mono'; and the
EXT SP Output Jack a Stereo Jack that is wire 'mono'.
.
The reason for the question is pluging a Stereo Plug into a mono jack;
can cause a shorting out of the output and "No Audio". However,
pluging a Stereo Plug into a stereo jack (wired mono) would simply
cause a both left and right stereo channels to be the same "mono
audio".
.
George, you may wish to try the set-up over again using a
Stereo-to-Mono Adapter.
.
As a General Rule: Make Sure that the Plug Matches the Jack.

Phil,

Yes, the amplified speakers have a volume control and use line voltage. When the speakers are connected to the 'REC' jack, the volume is very low and weak at max volume. I tried using the 'EXT SP' jack and the speakers work fine with more than ample volume. What do you think?

George

hi George:

if the amplified speakers do not have a volume control then you will
probably want to use the 'EXT SP' jack. if they take regular 'line
voltage' AND have a volume control then use 'REC'. i will listen in
on the responses and make changes in the next cookbook edition if
necessary.

regards,
phil :)

HI Phil:I have installed the sensitivity mod[the one's that include
the 1MH inductor and a 100 ohm resistor]and I can control a very
strong signal gain with the RF gain knob and the R-75 toggle
attenuator.No external attenuator or an external option needed.

RHF,

Appears that both, the 'REC' and 'EXT SP' jacks are mono. To receive sound from both speakers, you must use a mono adapter plug; this mono adapter plug is inserted into the R75 jack, and the stereo plug with cord (which is attached to the speakers) is plugged into the mono jack. Both jacks perform in the same manner, that is, you need to use the mono adapter plug to receive sound from both speakers.
Thanks anyway.

George

George & Phil,
.
Are both the REC Output Jack and the EXT SP Output Jack: Mono Jacks
that are wire 'mono'.
.
Or, is the REC Output Jack a Mono Jack that is wire 'mono'; and the
EXT SP Output Jack a Stereo Jack that is wire 'mono'.
.
The reason for the question is pluging a Stereo Plug into a mono jack;
can cause a shorting out of the output and "No Audio". However,
pluging a Stereo Plug into a stereo jack (wired mono) would simply
cause a both left and right stereo channels to be the same "mono

Dear Mr.Jordan

>I have my set carefully calibrated to be dead on frequency
>at 5 mHz and is only off -1 hz at MW and +1 hz at 15 mHz. I am
>unsureif the TXCO itself results in this very high frequency
>accuracy but I can highly recommend.

Great! The accuracy is within 0.2ppm!

Also I'm interested in your software for measurement.
I measure frequencies of some TPDX stations by comparison between
their offset beat and refferrencial tone.
For example, I measured Liberian Communications Network(presumed)
as 5100.007kHz in this morning. First,I set my R75 in LSB-mode,
then set the frequency around 5100.3kHz in VFO mode. Second, I recall
the 5000.250kHz (LSB-mode) from MEMO chs. 5000.250kHz provides a
250Hz tone caused by HLA or WWVH just on 5000kHz.
So, I tune carefully around 5100.3kHz for coincide two tones,
changing VFO/MEMO.
I needed about 30seconds for measurement Finally I found, on
5100.257kHz, R75 told me the same tone to 5000.250kHz. Therefore
I measured 5100.007kHz.

Also I measured Radio Tanzania to 5050.084kHz by same way.
DXing with R75 is really fantastic.

Regards,

Manabu Doi, a SWL in Okayama Japan

That's almost certainly the case, Phil. Most sound cards can drive
small, unamplified speakers directly. One of mine has a 20 watt amp
in the output. Also, the "rec out" jacks on my 8500 are at mic level,
not line level, so the R75 may be the same way.

Hi Phil,

I just remembered that I originally bought the amplified speakers for an inexpensive portable cassette player. The cassette player didn't have a speaker so I connected the amplified speakers' connection to the headphone output of the cassette player; it worked fine. Also in the distant past, I used the speakers with a small Sony shortwave radio (ICF PRO80); I did the same connection as with the cassette player and the Sony worked fine.

Let me ask you this: Do you see any harm in connecting amplified speakers to the 'EXT SP' jack? I'm concerned about damaging the R75 but not the speakers - was thinking that maybe the R75 could receive feedback from the speakers. I remember reading posts that some group members are using amplified speakers and I'm wondering which jack they're using. When I get some time, I'll search the posts and ask them. Thanks,

George

Did you mean to say 19 watt and not 19 amp? I searched the RS catalog but they no longer have Optimus speakers. I then call RS and was informed that Optimus speakers are being discontinued. Do you have an item number for the speakers as they still have some on clearance but they need the item number to search inventory? Lastly, do you get much volume from the Optimus speakers when using the 'REC' jack?

Topic: 2171 Message: 2188

George,

I think you've found the problem. There are amplified speakers that have a low impedance input that was designed to be plugged into the headphone jack of a portable music player, and there are those with high impedance inputs designed to be plugged into the "line out" jack of a soundcard, etc. The former should be plugged into the ext-speaker jack, the latter into the rec-out jack.

The R75 should be perfectly happy with your speakers plugged into the ext-speaker jack, since the low impedance load presented by them looks just like a speaker. I think I would turn the R75 volume down as low as it will go and still give you adequate max volume in the speakers, and then use the speakers volume to control as needed. This will make the speakers do all the work and let the R75 run cooler, not that it's a problem, but that can only be a good thing.

NJAR,

How would I know whether the speakers (Koss ES-50) are low impedance or high impedance? Should I locate the brochure that came with the speakers (actually I looked for the brochure but could not find it, I'll try again)? What would tell me about impedance? There is nothing noted on the speakers. I tried locating a web site to give me specs but didn't find anything.

Phil,

Ok, I understand. I have located but not bought the Optimus speakers someone mentioned (sale for $15, reg. $50) which will work from the 'REC' jack, thereby having the ability to use the R75 speaker and the amplified speakers together. In your opinion, with all things being equal, would it be best to attach my Koss amplified speakers to the 'EXT SP' jack or the Optimus speakers to the 'REC' jack. In other words, which output jack places less stress/load on the R75, or doesn't it matter?

George

Yes, butbutbut....

Most active PC speakers are designed to work with a variety of sound cards. 3 of my 5 cards produce output strong enough to drive speakers directly; one of them has a serious amplifier onboard.

I think you'll have no problem plugging in the PC speakers to the EXT SP jack. Especially if the speaker's on/off switch directly connects the speaker to the cable.

If you can run them that way, great. If not, try the other method. The obvious cue that you are driving the input too hard will be very harsh distortion.

Now. That said, I do have *one* set of speakers that expect very low level input -- Cambridge Soundworks speakers. However, they have definitely been the exception, not the rule, and they came with an in-line volume control for attenuation.

Hmm. Might mean that you need to up the pacing delay just a bit. As it steps up through the memories, it may not be correctly receiving data on the ones you are missing. The thing that's odd, is that if there is such an error the program is supposed to alert you so it can retry. I'd have to investigate why this alert may have never appeared, if that's the case.

Eric,

My Koss speakers have the volume control directly on the speaker case, not the cord. What model Cambridge Soundworks speakers do you have? I understand they make a real fine product. Have you ever heard the Icom ext. speaker (I think it's the SP21)? Many in the group characterized the sound as "muddy" but it appears difficult to achieve great sound for voice and otherwise.

Most speakers have the control on the speaker case. I believe this was
a cheap way to correct a design misunderstanding.

Henry Kloss was never big on model numbers... the only distinguishing
tag on these is "microworks" on the subwoofer.

These are high fidelity speakers and aren't really a good choice for
a short wave receiver.

I haven't heard the SP21. I don't use my r-75 much these days.
My 8500s have no fidelity problems at all, so they (I have 2) don't
need external speakers.

hi Mark:

i was curious what this 'delay' is that everyone is talking about. is your program sending the data faster than the ICOM can process it? i sometimes notice if i do not do a small delay (say 50 mS) that the ICOM will sometimes 'eat' the next command.

phil :)

Phil,
> i was curious what this 'delay' is that everyone is talking about. is

My programs use an synchronous polling system, where it sends something and then expects something back in order to process it. An asynchronous alternative is to send commands and then just process things from a queue as they come in. The latter method can be somewhat reliable if you can later decipher what each received string was a response to. The former can be more reliable, but needs a timing window to work within, which I call a pacing delay.

The delay in a polling system paces a command string sent from the program, and also acts as a timing window for things to come back. If nothing comes back in the allotted time, then I know to retry the poll. All of my programs try 3 times to get a response. If nothing comes back after 3 tries you get a beep, telling you that something failed. This also allows the user to tweak a value that fits the radio, as well as the computer's processing speed.

Since the serial rate is fairly fixed for each product (SIC32 expects the 19200bps rate, whereas SRC32 uses 9600bps), the main difference to the user is basically computer speed and the response time of the radio. The same pacing delay would work different for someone using a 486DX/33 vs. a P4/2.33. The smaller the number, the better the response time, but polling reliability decreases. The higher the number, the response time suffers and seems sluggish, but the polling reliability increases.

Hopefully I didn't fill this with too much comms-engineer-speak. <G>

howdy Mark!

> My programs use an synchronous polling system

when i need a response what i do is send the ICOM a command and set a timer so that it can be checked. if nothing is in the queue or the queue is not filled with the response to that particular command the timer can be reset. this sounds similar to your polling method. i never got around to testing how fast the ICOM responds... might do it sometime just out of curiousity.

> Hopefully I didn't fill this with too much comms-engineer-speak. <G>

no, i liked your post. it is nice to be able to talk to radio people who also program... especially someone who is the author of a really good control program: Smart ICOM Control!

regards,
phil :)

I used to be involved with an air-ground reporting network that also used a serial polling system, called the Net Radio Protocol (NRP) used on ARC-164s [some former 98Gs may have even used it and not known it <G>]. There were ACK/NAK mechanisms for supporting polling and it was designed into the system. What I provide is a workaround to try to assume ACKs and NAKs based on timing.

> timer so that it can be checked. if nothing is in the queue or the

This is similar to what I have, although I'm not using timer resources - just a simple mSec delay counter.

> never got around to testing how fast the ICOM responds... might do it
> sometime just out of curiousity.

I was going to mention this in the last post. Interesting things is that radios (including the R8 and NRD series) seem to take a bit longer to process memory actions than regular tuning actions. I can't precisely quantify just how much, but it is significantly slower - adds as much as 10-20mS or so, depending on the radio and even sometimes what memory channel it is in.

> Also I'm interested in your software for measurement.

I use an application called Spectrogram. The application basically samples the audio output of your receiver and creates a spectrum analysis. I find configuring the software to display the 50 to 150 Hz portion of the spectrum and then making frequency measurements 100 Hz from carrier frequency while in USB (or LSB depending on intereference).

After correct frequency (to 1 hz) is determined then I can just tune up (or down if in LSB) 100 Hz and be directly on frequency. This method only takes a few seconds to make a measurement.

I haven't tried this, but you should be able to make a "converter" as follows instead of buying new speakers: Go to the Shack and buy an audio output transformer and the appropriate jack and plug. Connect the EXT SP jack to the low impedance winding, and the high impedance winding to the Koss input. While you're at it, you can make sure both stereo inputs are fed with the same signal: use a stereo jack but wire both inputs in parallel to the transformer output.

hi Mark:

interesting post! i am working on a scanning program. i added a 50 mS
delay similar to what you described to help guarantee a non-empty
queue... i also use it as spacing between outgoing commands to
prevent overrun. part of my "get it running, tweak it later" :D.

> radios (including the R8 and NRD series) seem to take a bit
> longer to process memory actions than regular tuning actions.

i suspected this... and it makes me even more curious about the
timing (i'll test it eventually). the R75 uses an 8-bit Hitachi mcu
running at 9.8 MHz and although it is capable of ~1 MIP it may have
plenty to do and has only 2k of working RAM. btw, i also suspect
there are some easter eggs... a lot could be said on that screen ;).

phil :)

I don't think you can fine-tune the stepsizes on almost any radio, except for possibly multiples of ten (i.e., by the readout digits). I never could understand that considering program listening, where stations are basically spaced 5kHz apart; or for ship-to-shore, which depending upon band type can be 0.5kHz (digital) or 3kHz (voice). Even European BCB is 9kHz, which is rarely switchable on desktops.

The R-72 was available without software.
Also I am interested in HF airband,such as LDOC.
In those areas,the chs are separeted in every 3kHz.
I prefered the LDOC ch for Varig Aerocraft on 11366kHz USB.But,long
ago,
it was discontinued to use.Probably it went to sattelite.

I want to know 3kHz-step is available or not on R-75.

Mark,

The IC-R8500 has a variety of tuning steps:
10 Hz, 50, 100, 1 kHz, 2.5, 5, 9, 10, 12.5, 20, 25, 100, 1 MHz plus a
programmable step that can be set to any value (3 significant figures, I
believe) between the lower and upper limits -- defaults to 50 kHz.

I've got both, the 320 is a lot of receiver for the money (around $200 if you can find one used). Not a whole lot different from the r-75 minus the DSP features and the knobs (well, maybe it is a whole lot different). I've found 2nd party software to be better than TenTec's. Forget the included rod ant. for doing any serious listening.

Yes, I have one of each.
The Ten-Tec RX-320 is a great radio.. too bad it doesn't have knobs!
Go for it!

2224. Long Wire vs. Dipole

Yahoo group: icomr75 (2000 — 2002)
Date: 2002-08-10 01:59:15 UTC
From: Moxie3
Topic: 2224 Message: 2224

Have any of you tried using both, the long wire & dipole antenna? I ask because I've been using a long wire antenna (about 110 feet) and finally installed a dipole. I expected much greater reception from the dipole, a B&W brand, as compared to a long wire. However, I found my long wire to have a higher signal on the R75 meter on all frequencies. Wondering if anyone else has experienced the same.

2225. longwires n dipoles

Yahoo group: icomr75 (2000 — 2002)
Date: 2002-08-10 08:31:34 UTC
From: Jem Cullen
Topic: 2225 Message: 2225

I got a long wire and a dipole both approx the same total legnth height and direction.

There's no doubt about it on most freqs the long wire shows stonger sig stregnth with same signal then the dipole. On some freqs the dipole is just plain deaf, and on its resonant freqs the dipole really shines, so its more "peaky".
That said, the dipole is always much quieter in b/g noise so even tho its showing less S-units the signal is clearer, and much more understandable, so for mine the dipole is the better antenna.

another trick I use on some freqs is just connect one wire of the antenna lead from the dipole to the back of the rig or atu, and leave the other floating in mid air. just the connect the ant wire and leave the ground off

99% of the time i use the dipole. I think its a great ant.

Jem,

What do you mean by 'resonant' frequencies? I had assumed that if the signal meter indicated a lower signal reading when using the dipole and a much higher signal reading with the long wire, both on the same frequency, the long wire is a better antenna because of the higher signal strength. However, you are saying that the signal strength could be less with the dipole yet the stations being received are clearer and more understandable because of less background noise. I didn't realize that background noise increases the signal meter. Maybe this is why I sometimes receive a high signal meter reading but I don't hear any station; does this sound right to you?

Topic: 2225 Message: 2228

That's right. The signal strength meter cannot tell the difference between signal and noise and just measures rf energy present at that frequency and bandwidth.

Dear members,

Scarcely I employ dipoles in a mobile operation.
This is superior in S/N, but its range is rather narrow.
The place where dipoles available is very restricted here Japan.
So, I must care to the pedstrians, even in river side.
The rails on automobile's roof is useful for carring up the dipoles.

2230. Icom IC-R75 Modifications.

Yahoo group: icomr75 (2000 — 2002)
Date: 2002-08-16 01:40:29 UTC
From: Rodger N. Bird II
Topic: 2230 Message: 2230

I am thinking about modifying my Icom IC-R75. After looking over the Kiwa modifications on http://www.kiwa.com/R75.html, I really do not have an extra $185.00 for all of the modifications. I do not care about the Synchronous Detector. I never use it.

The 450 kHz filter update sounds interesting and should be easy to perform.

"450 kHz Filter Upgrade
The 450 kHz filters come stock with two bandwidths; 15 kHz and 6 kHz. The 15 kHz filter is used for both Synchronous AM and FM reception. We remove both the 15 kHz and 6 kHz filters. The 6 kHz filter is installed in the 15 kHz slot. (Please note:this mod will affect FM performance) A 3.8 kHz filter is installed in the 6 kHz slot. The improved selectivity will enhance synchronous AM reception under difficult signal conditions.
(This is the same filter we supply for the ATS909 and CC Radio.)"

Has anyone performed this modification themselves?

I am very interested in the "Audio Upgrade" modification:

"Audio Upgrade
Key components to the audio power amplifier are replaced to enhance clarity and definition.
Audio Upgrade $35.00"

Does anyone know what Kiwa does for $35.00? Are there instructions available for this modification?

The only modifications I have found are for the Synchronous Detector. Any help or information is greatly appreciated.

Thank you,

Rodger

I live in an apartment house, on the ground floor. I can't put anything up in the air. I tried a Sony amplified antenna mounted on a post (height at top about ten feet) and it wasn't worth anything.

Any ideas on what would work well? I live in the Livermore Valley, mountains about 2,00 feet on most sides. My apt faces south. One floor above me.

I got such poor reception I put the radio away.

Thanks
James

If a simple wire around the apartment doesn't work, I guess you need to go with an amplified antenna. Which model Sony antenna did you get? There is a manufacturer which makes a pretty good amplified antenna, so I'm told. It's called the Skymatch amplified antenna and it may work for you. I believe Grove still sells them and I think you can return it if it doesn't work..

Do you have any garden, or at least somewhere outdoors that is 15+ feet
away from PCs and other noisy electrical kit? If so you could consider
the Wellbrook ALA1530 active loop. I have one tied to a wooden fence at
about 2 feet above ground level about 15 feet from my PCs and it works
so well that I took all my various wire aerials down after comparing
them with the ALA1530. Not cheap but works well.

http://www.wellbrook.uk.com

Cheers,

Mark.

I live on the bottom floor of a ten story apartment (steel reinforced concrete) in NW DC. There are hills about 150' high to the north and west. On top of the western hill is the antenna farm for most radio and TV. Meanwhile... I am also surronded by embassies and other such facilities with radio transmission facilities.

I have a Stoner Dymek 100 which has, conditions permitting, allowed me to receive South Africa, India, Viet Nam, and Japan, not to mention nearer broadcasters. I routinely listen to AFRS from Puerto Rico on SSB. It is mounted indoors next to a window.

To install simply plumb it together and get a connector (Radio Shack) to screw it into the back of the radio.

Try about 75 feet of #12 coated wire run around your apartment. It will work even better if you can run it outside somewhere. It works for me.

Rodger - although you say you do not care about the sync det, the AGC mod that fixes it is the best mod of all - it takes the flutter out of the AGC by making the slow time constant kick in the way it is supposed to, and makes the whole thing sounds much sweeter.

The filter mod is also excellent. It simply makes a world of difference. I don't know why Icom didn't do this to begin with.

I am not sure how important the audio upgrade is - the receiver sounded pretty good with a $20 Radio Shack speaker, and doesn't seem to be much better after the mod.

My Icom has been just a real treat after the Kiwa mods. In a poor receiving location (much QRM) and with modest antennae, I get the world, from the Big Boys to the petite Latin American ladies and everywhere else too. It's a fine radio. At first, I felt I was taking a gamble, and the stock R75 did not live up to my hopes - but the Kiwa mods fixed all that.

I see no need for an R8b.

James - I live 25 miles west of you. I doubt if the low mountains are giving you grief - more probably, the steel structure of the apartment. Also, this is not the DX time of the year - wait two months. My reception is not great this time of year either.

Meanwhile, tell us more about your situation. Do you have a fence? Could you toss a very thin wire up the side of the building? Could you attach a wire to any large metal object on the outside of the building? Think of anything else you can...

2244. * AUDIO MOD FOR BETTER SOUND *

Yahoo group: icomr75 (2000 — 2002)
Date: 2002-08-16 18:37:02 UTC
From: theshopt
Topic: 2244 Message: 2244

Where can a person get this Audio Mod for the R75 that being talked about all over? I guess KIWA is supposed to be doing something like this too. Anyone else have the parts list and where to put them in at? Can't be too big a deal to do.

Anybody- UPLOAD the diagram man.

As I mentioned earlier, I'm not sure the audio mod is that critical. I think the AGC mod is most important, and the filter mods are nice to have.

Having said that, Rado designed the AGC-synch mod, and his basic fixes are simple for someone familiar with a soldering iron, and very inexpensive.

All of the mods may be found on link sat this page:

James,
.
Recommend you take the time to read a few of the various 'antenna'
sections on the Hard-Core-DX.Com WebSite.
Here are two "In Doors" antennas for you to consider:
.
* Carpet Loop Antenna: A High Performance Indoor MW/SW Antenna
By David Moisan: The Carpet Loop is an Inexpensive, Easily Built, High
Performance Antenna that can work in almost all
homes & apartments.
http://www.hard-core-dx.com/nordicdx/antenna/hidden/carploop.html
http://www1.shore.net/~dmoisan/faqs/carpetloop.html
The name given to the antenna was "Carpet Loop" (full room size and
hidden), but my 'carpet loop' is mounted around the parameter of the
ceiling and it works very good for Shortwave. I simply used white
telephone cable; but others have been fancy and used wood molding to
cover the loop up from view. At one time, I read a posting on a
'carpet loop' mount around a wall that was used as a E-W or N-S
directional loop (still trying to re-locate that posting) .
.
* The "Broomstick" Antenna: A Compact, Easy-to-Build Shortwave
Antenna by Arnie Coro: This is a "helically wound" compressed long
wire (200-300Ft) antenna. It may be used with or without an
Antenna Tuner.
http://www.hard-core-dx.com/nordicdx/antenna/special/bromstik.html
+ also + "Tune-A-Stick" Antenna + A wire-wound 'broomstick' antenna
by Douglas Boze (More BroomStick Construction Details)
http://www.hard-core-dx.com/nordicdx/antenna/special/tunestik.html
.
For Additional Special & Hidden Antenna Information on HCDX:
.
* Here is the Index WebPage for "Special" Antennas at Hard-Core-DX.
http://www.hard-core-dx.com/nordicdx/antenna/special/index.html
.
* Here is the Index WebPage for "Hidden" Antennas at Hard-Core-DX.
http://www.hard-core-dx.com/nordicdx/antenna/hidden/index.html
.

Yes Bruce:You only need the AGC mod,I did both,the AGC mod first.The Agc in a stock R-75 have a very fast time constant and you can have problems with some stations in AM mode.The easy fix is to install a 220 uf cap pin 4 {IC MC1022},+ to the pin 4,- to ground.After this mod I found the audio OK,then out of curiosity I did the audio mod but I don't find a big difference.After the AGC mod you only need an external speaker for improving the audio in AM.

I've looked at their website and found discussion about improving an audio stage and a kit for the R71. I certainly can't compare the audio quality of the R75 to the R71a. The latter was absolutely dismal in AM. I own a stock r71a that I bought in the 80's that would drive you up a wall to listen to AM, even with a quality external speaker. During a ship's re-fitting of their radio room console, we pulled their reserve receiver which was a R-71a in a rack mount that was apparently modified/upgraded by EEB with audio circuit enhancements and a board containing mechanical filters. We also had a stock R-71 in the shop that we used for "sniffing" around a chassis. An A/B test between the both of them on our shop's broadband,terminated loop revealed an amazing difference in not only the AM, but SSB audio. Gone was the wooly AM and the SSB was very full and punchy. We popped the cover to take a peek and the very first thing that we noticed was globs of what looked like liquid paper potting the replaced/upgraded components. While we certainly couldn't remove the stuff or try to reverse engineer what they had done, it was immediately apparent after looking over the service manual that for the most part, the audio stages had a lot of coupling and decoupling caps replaced. There was also an apparent change to many of the components distributed throughout the agc line. Our best guess was that someone had figured out the transit delays through the stages and carefully compensated the time constants that controlled the gain of each controlled stage (could the propagation delays through a mechanical filter be that different or was this another Icom flaw?). Naturally, the first thing that we looked over was the AM detector stage. If one was to accept the argument that some of the shortwave and amateur publications were claiming that the bad AM was because of Icom's classic AM detector design with too small of a load impedance that caused a clipping of the am signals causing the famous distortion, then this modification must have not considered that important. The detector stage was untouched. There was however obvious replacements of switching diodes in the signal path and around the upper filters....presumably with schottkey barrier diodes. The end result was a very pleasing receiver to listen to that sounded much more like what you would have expected to hear from a ship's main class communication receiver. After reading the page on Kiwa's website, I sort of wonder if Kiwa was responsible for the mod's done on EEB's Icoms. The R-75 is no where near the obnoxious audio of the R-71 and actually pretty good on AM by comparison. I would be very curious about what the audio enhancements of the Kiwa mod offer over a stock R-75. Personally, I'm less interested in the sync detector modification as I feel the AGC could use some improvement.

Hello,
I am an old timer, having built my first SWR from a Heathkit back in the '60s.

Currently I have a ICF 2010, a Grundig M800 and YB 400, and a Shack DX-390. I used to do a lot of camping but now I am retired and tired. <sigh>.

I am very close to making a decision on another radio, either an IC-75 or a Ten Tec 350. (with a SW77 a distant 3rd.)

My only hesitation on the iCOM is the sync detector. I am spoiled by the 2010 and it works as well on the M800. But I see that KIWA has a mod to make it work. I wonder if the old eyeballs and shakey hands would work well enough to install it.

Anway, just wanted to say "hi", and let you know that I am madly reading all of the groups files and messages.

BTW, who has the best deal on a '75?

If I were considering another R-75, I would wait and periodically check Universal Radio (http://www.universal-radio.com/) or Lee Select (http://www.leeselect.com <http://www.leeselect.com/>) For a price of $560 or less WITH a bonus of the free DSP unit. You'll want the DSP in any event so hold out for a "free" one. I would then take the money you "saved" on the DSP and apply it to the KIWA mods - and let them do it with a warranty. While you're waiting for a price drop you can put a little away for the KIWA mods and it won't hurt as much!

From: Moxie3
Topic: 2256 Message: 2256

Help!

I have a long wire antenna hooked to ANT 1 and a dipole to ANT 2. Since installing the last antenna, the dipole, I have always kept both connected when using the radio, and the reception for both antennas are about the same.

However, today, I noticed something strange. I discovered that if I disconnect the PL 259 from ANT 2, there was no noticeable difference in reception with ANT 2. Then, when I disconnect wires from ANT 1, with ANT 2 wires still disconnected, reception to ANT 2 is diminished but not totally gone AND there is NO reception with ANT 1. To rehash, there is no noticeable difference with ANT 2 reception with or without the ANT 2 antenna connected, but there is a great decrease in reception if ANT 1 antenna is disconnected. When ANT 1 antenna is disconnected, there is no reception to ANT 1 but there is reception to ANT 2. Lastly, with antenna ANT 1 disconnected, the reception to ANT 2 is the same with our without the ANT 2 antenna being connected. Does this make any sense to anyone?

George

Rik,
Not so because when the long wire antenna is connected to the ANT 1 connectors, the radio receives best with ANT 1 selected, not ANT 2.

I've been saying I have a long wire antenna but, according to Joe Carr's Receiving Antenna Handbook, it's called a random wire antenna - whatever.

Jim,
This is totally confusing but your explanation of 'commonality' sounds reasonable. From your experience, do you believe that either antenna works best separately if both are connected at the same time? In other words, is it best to always connect both antennas even though you intend to receive from only 1 antenna?

Are you using the front panel ANT control to switch between the two connectors (antennas)? If you look at sheet 6 of the schematic in the files section you will see that both connectors are not active at the same time. The antenna you wish to use is selected by the ANT switch. You state "if I disconnect the PL 259 from ANT 2"; isn't ANT 1 for the PL-259?

Regards,
Bob

Subject: RE: [icomr75] Help: Strange Antenna Happenings

Are you using the front panel ANT control to switch between the two connectors (antennas)? If you look at sheet 6 of the schematic in the files section you will see that both connectors are not active at the same time. The antenna you wish to use is selected by the ANT switch. You state "if I disconnect the PL 259 from ANT 2"; isn't ANT 1 for the PL-259?

Regards,
Bob

Subject: [icomr75] Help: Strange Antenna Happenings

Help!

I have a long wire antenna hooked to ANT 1 and a dipole to ANT 2. Since installing the last antenna, the dipole, I have always kept both connected when using the radio, and the reception for both antennas are about the same.

However, today, I noticed something strange. I discovered that if I disconnect the PL 259 from ANT 2, there was no noticeable difference in reception with ANT 2. Then, when I disconnect wires from ANT 1, with ANT 2 wires still disconnected, reception to ANT 2 is diminished but not totally gone AND there is NO reception with ANT 1. To rehash, there is no noticeable difference with ANT 2 reception with or without the ANT 2 antenna connected, but there is a great decrease in reception if ANT 1 antenna is disconnected. When ANT 1 antenna is disconnected, there is no reception to ANT 1 but there is reception to ANT 2. Lastly, with antenna ANT 1 disconnected, the reception to ANT 2 is the same with our without the ANT 2 antenna being connected. Does this make any sense to anyone?

George

Well George, I can't answer that as at the time I experienced it I had a dipole connected to the PL259 and a random wire to the other. I wasn't happy with the dipole as it pretty much only resonated at atound 7.200 and there wasn't really anything there I wanted to hear. I have since disconnected the dipole and have run the random wire through coax to the PL259 and have nothing plugged in to the other connector. Even though the 2 connectors "should" be isolated from one another, I can't believe they truly are.

> Jim,
> This is totally confusing but your explanation of 'commonality' sounds reasonable. From your experience, do you believe that either antenna works best separately if both are connected at the same time? In other words, is it best to always connect both antennas even though you intend to receive from only 1 antenna?

>I would be very curious about what the audio enhancements of the Kiwa mod offer over a stock R-75. Personally, I'm less interested in the sync detector modification as I feel the AGC could use some improvement. <

My impression is that of the mods Kiwa offers, the audio mod is the least important. The change is modest at best, and to my ear even minor. The AGC mod and the synch mod, however, are practically the same thing, and highly desirable. The AGC and the synch are both "fixed" by the one mod. The filter exchange is also quite nice and very useful.

George to add to Bob's comments,
.
To understand the R75's dual antenna inputs:
* Goto the this eGroup's "Files Section".
* Click on the Information File.
* Select the Schematics.pdf (File).
* Scroll down to Page 6. "Main Utility (1) Schematic Diagram".
* Look at the Upper Left Corner (Grid A-6).
* Locate J101 the High-Z Antenna #2 Terminals and J111 the Low-Z Antenna #1 Terminals.
* Zoom in to 150% and Re-Center on Grid A-6.
.
1. Both antenna inputs have a common ground.
<Q> How good is your antennas and receivers external grounding point? Could one antenna be acting as a counterpoise or artificial ground for the other? Or, are both antennas collocated in close proximity to the other?
.
2. They both feed into RL121 (SPDT Relay) that is switched by your front panel "Antenna Switch".
<P> It is 'possible' that RL121 is the problem with having both antennas connected at the same time. Or, another 'possibility' is your problem is unique to your R-75 and your RL121 is defective.
.
3. Maybe, a better antenna relay design would have been a DPDT Relay switching in one antenna and grounding out the other antenna.
<S> The simplest 'solution' for you may be to connect only one antenna at a time. Plus 'grounding' out the other antenna when not in use.
.

RHF, the dipole antenna and the R75 are grounded to the same grounding block. I don't have a separate ground for the random wire. The ground wire is, I believe #4 copper and grounded to an 8 foot copper clad steel pole.

Both antennas are in close proximity to each other. The dipole and random wire run parallel with each other about 3 feet apart and for about 35 feet. Maybe I'll try grounding out 1 antenna while using the other and see if that works. thanks

George

Hi,

I just bought a Kiwa modified + DSP equipped R75. My only antenna right now is the Sony AN-LP1 loop, with a 3.5 mm mini plug output, and I am wondering how can I connect it to the R75, and to which antenna input.

Also what about the ground terminal on the R75 and this antenna?

Many thanks for your help

Hi gang,
I am wondering what antenna folks here use for the high side of the r-75? 30-50 Mhz? My first inclination is to grab a cheapie outdoor crossed dipole one uses for the FM band, but that'd likely limit the bottom end.

BTW, what does one DX in those freqs? The state police here used to use 50Mhz, but they are on a trunk now. I'm more interested in utility stations anyway.

Hello there nurseneuro2000!

In general the "front end" of a receiver refers to the RF sections, in the case of the R-75 there appears to be a lot of "front end". This would be the antenna selection, the pre filtration (RF Filter Circuit, there are actually 10 bandpass filters, selected according to the frequency), and two RF amplifiers, one using 2 FETs [discreet transistors] and one using an IC.

In short, the front end is everything before the IF.

Many low cost radios would have, at most, one transistor serving as an RF pre-amplifier, no antenna selection, no second Amp, and no pre filter.

Payman,

I'm still new at this stuff but....although there are an infinite number of opinions on grounding, the bottom line is that you should definitely ground the R75. The general consensus is that: Start with an 8 foot copper ground rod, and run heavy wire from the ground rod to a ground block, keeping the run as short as possible. Then run another wire, not as heavy as the R75 as the receiver can't take a very heavy wire. There are all sorts of adaptations you could use to run that shorter wire but the bottom line is to get a good ground.

2282. Best Ground Connector to R75?

Yahoo group: icomr75 (2000 — 2002)
Date: 2002-08-20 15:23:59 UTC
From: Moxie3
Topic: 2282 Message: 2282

Has anyone found a good ground and antenna size wire, clip or whatever to connect to the R75's spring loaded connectors? I've been using 14ga wire but it seems too bulky as it has a tendency to easily pull out of the R75's spring loaded connectors. What have you guys been using? I hate to use a real thin wire as I'm trying to keep the ground wire and antenna wire as close as possible to the 14 ga. wire coming from the ground block and antenna - but I realize that what I have isn't working so I have to make a change and go smaller. Any suggestions would be appreciated.

I use 12ga stranded wire for my ground. At the receiver, I removed just enough strands so that the cable just fits into the connector. I haven't had any problems with it pulling out. This wire is about 4 feet long, going through the floor to the 8ft ground rod right outside my room.

> Has anyone found a good ground and antenna size wire, clip or whatever to connect to the R75's spring loaded connectors? I've been using 14ga wire but it seems too bulky as it has a tendency to easily pull out of the R75's spring loaded connectors. What have you guys been using? I hate to use a real thin wire as I'm trying to keep the ground wire and antenna wire as close as possible to the 14 ga. wire coming from the ground block and antenna - but I realize that what I have isn't working so I have to make a change and go smaller. Any suggestions would be appreciated.

My problem isn't so much the wire fitting in the connector but staying in. Since I'm moving the receiver a few inches every time I use it, the movement may be loosening the connection. Maybe I need to place the receiver in a more permanent location. I wish there was a screw type terminal for the wires instead of the spring connectors but I guess you can't please everyone.

Hello - I agree, the ground connection is one more little thing that Icom seems to have messed up on this radio (which is not faintly praise it - it's a good radio - but just to point out that Icom was haphazard in some elements of its design). A good heavy lug connection would have been better and no more costly. If you were not afraid of operating, it would be easy to install one of these near the connection (but know that it will probably void the warranty).

My solution involves another piece of equipment. I have an MFJ-1026 (noise canceller) with a good heavy lug, to which is connected an 8-gauge solid ground wire to my ground rod. I have run a heavy braided jumper cable, just big enough to fit sungly into the Icom, from this lug. It isn't ideal, as it would be better RF-wise to run separate ground wires to a large bus (which I may do soon), but it keeps the ground wire in place. If you cannot fit a heavy solid wire into that spring clip, one could solder a short piece of braided wire, the right size to be a snug fit, onto the solid wire.

Beyond this, it sounds like a better spring clip or a good coax cable connection may be in order. Best of luck to you.

George,
.
I posted this once before, about an 'optional' Grounding Point on the R75.
.
First, IF - You are NOT using the RS-232C Jack.
(See Page 6 Item # 3 Icom IC-R75 Instruction Manual)
The RS-232C has two 'Binding Post' that are "Chassis" Ground.
* Use a Larger Size (16-12 AWG) Wire from your Ground Block.
* Use Stranded Wire for Flexibility.
* Allow an Extra 9-12 inches length in this ground wire, so you can move things around a bit with out having to disconnect everything each time you look at the set-up.
* Use a Screw Hole Type Terminal on the R75 end of this wire.
(Crimp of Solder this Wire Terminal Connection.)
* Use the appropriate size screw (4-40?) and lock washer for the Binding Post.
* Hold the Binding Post with a small wrench and use a Screw Driver to tighten the screw.
NOTE: When you have to disconnect the Ground: Disconnect it at the Ground Block.
.
Alternative Grounding Point 'Modification':
This requires opening the R75 and thus may "VOID" the Warranty.
Open the R75; Remove the 'left mounting screw' from the High-Z Antenna Terminal Block.
Replace this 'left mounting screw' with a Combo Banana Jack/Binding Post.
Voila! You now have a Large and Strong R75 Ground Point.
You may use a Banana Plug as a Ground Wire Terminal.
Or you may simply wrap the wire around or pass it through the Binding Post and tighten it down.
.
~ RHF
.

Strange. Mine doesn't come out no matter how hard I pull on it (I don't want to break the connector) I had to remove strands as it was too big for the hole. Maybe yours will hold better if you try what I did? Maybe your spring is just weaker or the tooth isn't sharp enough to bite into the wire. Don't know what else to tell ya...

Oops! One other thing you could try... Put an eyelet on the end of the wire and use one of the case screws to bolt it down...

2289. Re: Help please: Sony AN-LP1 connection to R75?

Yahoo group: icomr75 (2000 — 2002)
Date: 2002-08-21 01:16:52 UTC
From: payman_a
Topic: 2275 Message: 2289

George,

Thanks for your reply and suggestion.

As for connecting the Sony AN-LP1 to the R75, I found
the solution too. One needs either a 3.5mm mini female
to UHF male (PL-259) adapter, or in its absence, can
try other combinations such as 3.5mm mini female to
RCA male followed by an RCA female to UHF male adapter.

Regards

payman

--- In icomr75@y..., "Moxie3" <moxie3@e...> wrote:
> Payman,
>
> I'm still new at this stuff but....although there are an infinite
number of opinions on grounding, the bottom line is that you should
definitely ground the R75. The general consensus is that: Start
with an 8 foot copper ground rod, and run heavy wire from the ground
rod to a ground block, keeping the run as short as possible. Then
run another wire, not as heavy as the R75 as the receiver can't take
a very heavy wire. There are all sorts of adaptations you could use
to run that shorter wire but the bottom line is to get a good ground.

Radio Shack has a "communication headset", basically a lightweight monaural headset for CB, scanner, SW, and Ham radios on sale for $6.49 till August 25 (down from $12.99).

Search for part number 20-210. You will need to use a coupon for this, which can be printed from

http://www.radioshack.com/Coupons/Coupons.asp

Has anyone used this headset?

Thanks
payman

No, but for that price I'm willing to give it a try for fun :-)

It really does not have a very hard job; all it needs to do is reproduce sounds more-or-less linearly from about 200 to 6,000 Hz without excessive much distortion. If it can do that, and it doesn't break after a couple hours' use, it's a major bargain. I usually use a $90 pair of Sony stereo headphones, and they sound great, but they're almost certainly overkill for this application.

Thanks for the heads up! I might buy one after work and see how it works...

I have had one for several years. It is lightweight, good audio, fairly comfortable for extended listening. It does not block outside noise if that is important. The foam ear pads deteriorate rather quickly, but can be replaced. You will need a 1/8" mono to 1/4" mono adapter so it will fit the R-75 headphone jack. I think it is a good buy for 6.49.

To All,

I have one, ONE, set of headphones that serve for all purposes. They are Etymotics. Check my review at epinions.com. I bought them with a full return guarantee and wouldn't have paid that kind of money, after trying them out on everything form my shortwaves to my major stereo, unless they were the best headphones I ever heard... and that beats the ding out of speakers... for any use I can imagine.

Yes, I did quite a bit of research and read many reviews about headphones and found that that the Etymotics are simply the very best. They are considered an earphone and they go into the ear canal, and are reference quality sound reproduction. Although they are expensive. They also cancel-out noise on a passive basis, that is environmental noise, not noise coming from the receiver. If anyone is interested, do a search and check out their site and the reviews. If anyone can't get the info, let me know as I have the site address and prices, I just have to look for it. And no, I didn't buy a set as I don't believe I would like something in my ear, it takes getting accustomed to. I originally researched them for its noise canceling properties for use while flying, and found them better than anything else on the market. But instead, I bought an inexpensive pair of NosieBuster headphones, an active noise canceling headphone. It is manufactured by NCT, the same company that designed, and I believe manufactures, the Clear Speech speaker and base unit used widely by hams. NCT also is the innovator of the flat speaker (for use on wall or desk) which I have 2 of.

Topic: 2290 Message: 2298

Depends what you want to listen to, 200 to 6,000 Hz wouldn't work for me. I Haven't done a spectrum analysis on the R75 yet but I bet it's picking up AM broadcast band/SW music and Lo-Fi Hams below 200Hz, more like 60-80Hz and up. Marty

-----Original Message-----
....all it needs to do is reproduce sounds more-or-less linearly from about 200 to 6,000 Hz ...

The radioshack speaker's specs claim it goes from 20 Hz to 20 kHz.

(this is taken from the Sony ICF-2010 Yahoo Group)

From: "gtorbeck" <gtorbec@a...>
Date: Thu Aug 22, 2002 7:43 am
Subject: Kiwa

I finally managed to talk to Craig Siegenthaler of Kiwa. Apparently Kiwa is relocating soon and production has been halted. Off-the-shelf items, such as filters, are still available, but other items, such as antennas, will not be until the move is complete and Kiwa is up and running again. E-mails are no longer bouncing, so if you have any specific questions you can contact Craig directly at the address given on the Kiwa web page.

You're right - but it probably gets down that low too. Personally, information less than 100 Hz doesn't do much for me, whether it is lo-fi music or speech. That's down in the mud.

Speaker? Or the headset? Most small speakers do not have that kind of range, uslaly it is more like 100/150 up to about 12,000 to 15,000. For typical shortwave listening, AM or SSB, that's a bunch more than you need. Heck, my R75 only delivers up to 6 kHz on freq with the wide filter...and that's 99% of voice.

You can view the US frequency allocation chart here:
http://www.ntia.doc.gov/osmhome/allochrt.html

Who gets what ...
http://www.rdrop.com/users/billmc/freq_list.4

The best listening is probably the Amateur 6-meter band (50 - 54
MHz), as well as military "skip". See
http://groups.yahoo.com/group/vhfskip/

and
http://www.geocities.com/scottish_scanner/Page1.html

From: Jamesz
Topic: 2308 Message: 2308

When you sink a ground rod make sure there aren't any gas lines around. Some older homes may not be in accordance with the building code and you may find something you don't want.

When I and a worker were sinking a wooden pole in my mother's back yard we hit a gas line where it wasn't supposed too be.

Yes, when it come to ground rods; Gas Lines and "Hold Your Nose" Sewer Pipes can be a problem. Anywhere within 4 Ft of a building is a 'possible' problem area when digging in the ground.
.
Remember: You Don't Know - Until You Look! Taking 15 Minutes of walking around an checking out the lay of the land as to where the 'utility services' are coming from can save your life and your wallet.

.
Another old 'safety rule' was to keep all parts of your antenna and ground system at least 5-6 Ft away from your buildings electrical service point. Not to protect the antenna or ground but to keep 'us' from completing the circuit (getting fried).

> for this receiver?

Nope, a Yagi is nice for listening on one band, but it's
absolutely not the best antenna for wide-band listening.

For shortwave, I would recommend a random wire as far
away from the house as possible, fed with coaxial cable
which has its shield grounded at multiple places.

I enjoyed putting the mod circuit ver 2.1 together, but I have pulled the top off my R75 three times now, and can't bring myself to solder on the pins of the motorola chip. The last and final time, I soldered a nice ground connection from the mod board, but failed miserably to solder to pin 15. I have a friend who works at a radio repair shop, and he should be able to make the connections from the mod circuit to the motorola chip for me. I figured some of you would get a good laugh from my cowardly soldering skills.

Nah, I'd never put my soldering iron inside my $500+ radio,
especially not since I can get much larger improvements in
reception by just putting up a better antenna ;)

My 14 meter T2FD works fine between 6 and 40 MHz and the
random wire works great between mediumwave and 9 MHz.

I bit the bullet. I went ahead and got all the wires soldered on to the chip, but couldn't get the synch mod to lock. I tried turning the variable resister, but to no avail. So, I took all the wires back off, and reset the 23 pin.

I may have to measure the values and check the mod circuit, or plan B, just send the radio to Kiwa and let them perform the mod.

Back in high school (a million years ago), my electronics teacher always use to say "don't let fear stop you" That's all the electronics experience I have! Transistors hadn't been around THAT long! I built a Radio Shack Globe Patrol shortwave kit (still have it!) and aligned and fiddled with my Halicrafters S-40 back then. Here it is, 2002, and I open up my R-75 to see a bunch of specks on a circuit board. Remembering the "Don't let fear stop you" thing, I used my trusty old magnifier light, dug out the old soldering iron and tore into it (after reading through the mod several times). It wasn't THAT bad. If I can do it, anyone can. I've since added the DSP unit and the speech synthesizer so I can stamp my recordings with the time/frequency/mode, etc. As long as you don't use a blowtorch and wreck the traces on the board, you can't hardly hurt anything. The pin-lift should be done gently though as the legs on i.c.'s don't like to bend very far without breaking...

2320. T2FD Antenna (was Re: The touch of an elephant)

Yahoo group: icomr75 (2000 — 2002)
Date: 2002-08-25 17:28:35 UTC
From: dawntredereding
Topic: 2312 Message: 2320

There seems to be a general confusion about the TTFD antenna that was designed by Countryman and the broadband creatures sold by B&W,Diamond/Icom,SGC,and others that sell and all band antenna using pvc spreaders and a terminating resistor. Countryman's design was not an "all band" antenna, had a semi-resonant design with a much lower feed impedance, and had a larger aperture. This antenna was designed to be mounted high up from ground for long haul communication. The antennas that you see sold as broadband antennas are a different creature with a different design purpose. This breed of antenna was originally designed by a gentleman named Elmer Bush for the military and govt. It was a compromise design that had specific objectives that the military needed in the early 80's when adaptive ssb communications were being developed by Collins and Harris. Frequency agile communication systems imposed new demands that were getting ahead of the antenna design. Most all military circuits used 32' whips or inverted L's along with a servo/mechanical or preset stepping soelenoid controlled coupler. All of the autotuners that were available at that time used servo motors driven by a phase detector. Most designs were also limited to preset bands that were selected by the radio. Mechanical autotuners were simply not fast enough. The compromise was a fast switching preset tuner that used relays which became the progentior of today's microprocessor controlled, frequency counting autotuners. Outside of a huge discone (telex,harris et al) or giant,log periodics that would become almost ridiculous in the 2-8 meg region that dependable point to point circuits operate, traveling wave antennas were the only acceptable solution. Elmer's antenna took in to consideration that the system was adaptable, needed dependable medium distance communication,would not be erected very high and required a lower profile. Besides this, it could be deployed rapidly and had a quieter loop characteristic that eliminated grounding/counterpoise problems. What would be considered weak points to an amateur became benefits to this application. Part of the derivation of this antenna came from another TWT design that military was using at the time typically called a delta loop. It too had a very high impedance transformer and was terminated with high impedance resistor at the top forming a triangle. It had a very large aperture and despite the pundits, was quite efficient.(B&W sells something like this too) Interesting note here was that the radiation efficiency could actually be measured. They simply removed the terminating resistor and replaced it with another balun back to 50 ohms terminated with a wattmeter and dummy load. You could then calculate the radiation efficiency. Bush's antenna too used a very high impedance to keep the high current points farthest from the feed. Typically it was about 2000 ohms using a 16 /1 balun like the delta loops. Efficiency wasn't the need here,

dependable communications was. The aperture is narrow and the antenna is typically mounted below a quarter wave at the lowest frequencies. This arrangement gives a NVIS characteristic at the 2-8 meg region with lower efficiency for dependable point to point short haul comms. in that normally difficult region between 100-300 miles. At the higher frequencies, the antenna has a good amount of gain and the take-off angle is much,much lower giving decent DX performance. This is what the military and feds wanted in what would eventually become part of their ALE networks. Local region systems that were networked 24/7 with the capability of long haul use to link with a distant region. BTW, this idea of a compromise broadband antenna that kept a frequency hopping transmitter happy while feeding a wet string also brought to use a rather embarrasing antenna coupler that was nothing but a dummyload that had screw-eyes mounted on it forming a random dipole or end fed antenna. As long as it kept the pa from toasting and was able to get a signal in the air,it would do. This device was sold to the hams by the same huckster that sold it to the military for over $300 as the Maxcom Antenna Matcher. He made fantastic claims and denied it was a dummy load till a magazine had one Xrayed. I think that Icom sells something like this to the marine and avaiation markets(MN100?) and maybe Yaesu still does too. Fast, microprocessor autocouplers have again taken the lead in these networks as well as other hf services. These antennas see a lot of use from aviation and marine users as well as state and federal govt. in the US. For a contingency ALE system on top of a large building in an urban area, it remains as virtually the only viable option short of a coupler fed loop or dipole.

First we need to know what kind of antenna are you using,where are you located,which station are you tunning,are you using a new or used radio with some problems,do you know how to set the antenna selector mode switch?,In this group file you can find and read the phil's R-75 cookbook,check all this and then report back.

> (better than a long wire)?

Yes and yes. I build a very low budget T2FD (TV coax, TV balun)
because those materials were the easiest to obtain. It's by far
the best antenna I've ever had between 6 and 40 MHz.

I've been trying for half a year now to build something better
than the T2FD, but I haven't succeeded.

The low frequencies are another story alltogether, my long wire
definately outperforms the T2FD, on mediumwave by up to 60 dB
and on 120, 90 and 60 meters also by a fairly wide margin.

On the other hand, the longwire doesn't work very well above
9 MHz, so the longwire and the T2FD complement each other very
nicely. I'm using a cheap ratshack antenna switch to quickly
switch between them.

regards,

Rik

Looking at those prices I'm always tempted to quit my
current job and go into the antenna business. ;)

I built mine with maybe $20 in materials ...

cheers,

Rik

Rick,

It seems like you've got it right with both antennas and have a nice setup. I assume you have a standard T2FD so if I want to build one I can just follow instructions on the web. But, pardon my ignorance, where can I get a TV balun, and what type should it be? I may do just what you did (two antennas, one for under 9 Mhz and one for above).

Thanks so much

payman

I got one of the cheapo 300<->75 ohm baluns people use in TV
cables. Note that some models don't work well on shortwave
while others do, I discovered the right model after some
experimenting ;)

As for how to build a T2FD ... just follow the instructions
roughly, you have to be a real master to construct a badly
working T2FD since nothing about this antenna is critical.

Here's a description of one submitted by our man in Havana,
Arnie Coro. Sorry about it being in all capital letters, but that's
the way it was submitted.

Dave

EASY TO FOLLOW INSTRUCTIONS FOR BUILDING YOUR OWN BROADBAND
SHORTWAVE RECEIVING ANTENNA

"THE TILTED TERMINATED FOLDED DIPOLE, TTFD OR T2FD"

BY ARNIE CORO
RADIO AMATEUR CO2KK
HOST OF RADIO HAVANA CUBA'S " DXERS UNLIMITED "
RADIO HOBBY PROGRAM.

(THE INFORMATION IN THIS ARTICLE IS IN THE PUBLIC DOMAIN AND
MAY BE PASSED ALONG TO ANYONE WHO WANTS TO IMPROVE THEIR
SHORTWAVE RECEPTION)
PLEASE SEND YOUR COMMENTS TO: ARNIE CORO
DXERS UNLIMITED
RADIO HAVANA CUBA
PO BOX 6240

HAVANA CUBA
OR TO OUR E -MAIL ADDRESS: ACORO@...

INTRODUCTION: THE TILTED TERMINATED DIPOLE ANTENNA VERSION
FULLY TESTED HERE AT RADIO HAVANA CUBA HAS PROVEN TO BE THE
EASIEST BUILT , GENERAL PURPOSE , LOW NOISE ANTENNA OF THE
MANY THAT I HAVE TRIED FOR GENERAL SHORT WAVE RECEPTION..
THE ANTENNA IS BASICALLY A FOLDED DIPOLE OF ONE THIRD OF A
WAVELENGTH, OVERALL LENGTH, AT THE LOWEST FREQUENCY YOU WANT TO
LISTEN TO WITH MAXIMUM EFFICIENCY. THE ANTENNA WILL PERFORM
WITH LOWER EFFICIENCY AT FREQUENCIES LOWER THAN THE ABOVE, AND
WILL RETAIN ITS EXCELLENT LOW NOISE PICK-UP CHARACTERISTICS.
IF YOU ARE NOT FAMILIAR WITH SHORT WAVE ANTENNAS I RECOMMEND
YOU TAKE A LOOK AT AN ANTENNA HANDBOOOK OR AT THE RADIO
AMATEURS HANDBOOK ANTENNA SECTION SO THAT YOU CAN HAVE A CLEAR
PICTURE OF WHAT A *FOLDED DIPOLE * IS.
THE TTFD: TO CALCULATE THE LENGTH OF YOUR TTFD,IN METERS, USE THE
FOLLOWING :

FORMULA: 100 DIVIDED BY THE LOWEST FREQUENCY IN MEGAHERTZ.

HERE'S AN EXAMPLE: FOR GENERAL SHORT WAVE LISTENING,
A GOOD LOW FREQUENCY CUTOFF IS 7 MEGAHERTZ. SO 1OO/ 7 = 14.28 METERS.
FOR ALL PRACTICAL PURPOSES, YOUR ANTENNA LENGTH CAN BE 14.3 METERS.
NOW WE CALCULATE THE SEPARATION BETWEEN THE UPPER AND THE LOWER
PORTION OF THE FOLDED DIPOLE, USING THE FORMULA :
3 DIVIDED BY THE LOWEST AT WHICH WE WANT MAXIMUM EFFICIENCY
FREQUENCY IN MEGAHERTZ. FOR OUR 7 MEGAHERTZ EXAMPLE, IT'S SIMPLY
3/7= SEPARATION IN METERS. CALCULATING 3/7 = 0.42 METERS, WHICH
FOR ALL PRACTICAL PURPOSES IS 40 CENTIMETERS.
TO BUILD YOUR TTFD, YOU NEED COPPER WIRE. IT CAN
BE STANDARD ANTENNA WIRE NO.16 OR NO.14, OR YOU CAN USE
PVC COVERED HOUSEHOLD. TYPE WIRE, USED IN TYPICAL HOME ELECTRICAL
CIRCUITS. NO 14 OR NO. 16 PVC COVERED WIRE IS IDEAL FOR ANTENNAS
THAT ARE LESS THAN 30 METERS IN LENGTH.
THE TTFD IS A FOLDED DIPOLE, SO YOU MUST REALIZE THAT THE
TOP PORTION OF THE ANTENNA IS DIVIDED IN TWO BY AN
INSULATOR LOCATED EXACTLY AT THE MIDDLE OF THE TOP SECTION.
THAT INSULATOR IS BRIDGED BY A CARBON RESISTOR OF 390 OHMS
AND TWO WATT DISSIPATION, FOR AND ANTENNA THAT IS TO
BE USED ONLY FOR RECEIVING PURPOSES. THE 390-OHM CARBON
RESISTOR MUST BE CAREFULLY SOLDERED TO EACH SIDE OF THE ANTENNA
AND PROTECTED FROM THE WEATHER BY PLACING IT INSIDE A PIECE
OF PVC SPAGHETTI TUBING SEALED WITH EPOXY RESIN. OF COURSE
THAT YOU WILL NOT MAKE THE SMALL 390 OHM 2 WATT CARBON
RESISTOR HOLD BOTH WIRES TOGETHER, YOU MUST USE A HIGH QUALITY
ANTENNA INSULATOR TO HOLD THE TWO UPPER WIRES TOGETHER, AND THEN
BRIDGE THE INSULATOR WITH THE 390 OHM RESISTOR. MY ADVICE IS THAT
YOU PROTECT THE 390 OHM 2 WATT RESISTOR FROM THE EFFECTS OF THE
WEATHER INSIDE A SMALL SECTION OF PVC PLASTIC PIPE, SEAL THE ENDS
WITH SILICONE AND LET ONLY TWO FLEXIBLE LEADS COMING OUT OF THE

SECTION OF PVC TUBING. IF YOU CANNOT FIND A 390 OHM 2 WATT CARBON RESISTOR, THEN YOU MAY USE A PAIR OF 680 OHM 1 WATT OR 680 OHM 2 WATT RESISTORS CONNECTED IN PARARELL TO SUBSTITUTE FOR THE 390 OHM RESISTOR. IF YOU ARE THINKING OF EVER USING THE TTFD AS A TRANSMITTING ANTENNA, THEN THE TERMINATING RESISTOR MUST BE MODIFIED ACCORDINGLY. MORE ABOUT USING THE TTFD FOR TRANSMITTING LATER.

THE LOWER PORTION OF THE ANTENNA IS ALSO INTERRUPTED EXACTLY AT ITS CENTER WITH AN INSULATOR. THE ANTENNA FEEDLINE CONNECTS TO EACH SIDE OF THE INSULATOR. YOU MAY USE 3 TYPES OF DOWNLEADS WITH THE TTFD. YOU MAY USE HEAVY DUTY 300 OHM DUAL BALANCED TRANSMISSION LINE, WHICH MAY BE AVAILABLE AS *LOW LOSS TV FOAM TWIN LEAD * OR YOU CAN USE A HOMEMADE PARARELL FEEDLINE OF VERY LOW LOSS MADE FROM TWO 75 OHM COAXIAL CABLES. THE OUTER SHEATH OR BRAID OF THE COAXIAL CABLES IS JOINED TOGETHER RIGHT NEXT TO THE ANTENNA INSULATOR AND THEN IT'S LEFT WITHOUT ANY CONNECTION. BUT PLEASE REMEMBER TO SEAL IT FROM THE ADVERSE EFFECTS OF WEATHER USING SOME KIND OF SILICONE CAULKING COMPOUND. THE CENTER OR INNER CONDUCTORS OF THE COAXIAL CABLES ARE CONNECTED ONE TO EACH SIDE OF THE ANTENNA. YOUR HOME-BREWED 150 OHM DUAL BALANCED AND SHIELDED TRANSMISSION LINE IS TAKEN TO THE SHACK, WHERE YOU CONNECT THE CENTER CONDUCTORS TO THE BALANCED INPUT OF YOUR ANTENNA TUNER. THE OUTER SHEATS OR BRAIDS OF THE 2 CABLES ARE ALSO JOINED TOGETHER AND SOLDERED, BUT HERE THEY ARE CONNECTED TO YOUR RECEIVING SETUP GROUND CONNECTION.
THERE IS ANOTHER WAY TO FEED THE TTFD WITH JUST ONE SINGLE 75 OHM COAXIAL CABLE , AND THIS IS DONE BY CONNECTING A 6-TO-1 BALANCED TO UNBALANCED (BALUN) TRANSFORMER RIGHT AT THE ANTENNA TERMINALS. THE 6-TO-1 STEPDOWN BALUN WILL PROVIDE A MATCH TO THE 450 OHM ANTENNA WHILE AT THE SAME TIME PROVIDING A MATCH TO THE 75 OHM COAXIAL CABLE.
THE TTFD CONSTRUCTION INVOLVES THE USE OF AT LEAST SIX FIBERGLASS OR PVC SPREADERS THAT KEEP THE UPPER AND LOWER WIRES SEPARATED FROM EACH OTHER AT THE CALCULATED DISTANCE, WHICH IN OUR EXAMPLE IS 40 CENTIMETERS. AT THE END SECTIONS THE ANTENNA IS SUPPORTED USING HIGH QUALITY DACRON OR NYLON FISHING LINES WHICH ACT AS VERY LONG INSULATORS.
THE TTFD ANTENNA MUST BE PLACED WITH ONE END AT THE TOP OF THE MAST AND THE OTHER END AT A LOWER HEIGHT SO THAT THE ANTENNA SLOPES AT AN ANGLE OF 30 TO 45 DEGREES, FROM THE HORIZONTAL.

PLEASE NOTE THAT IT IS EASIER TO ASSEMBLE THE ANTENNA IF YOU PREPARE THE WIRES FIRST BY CUTTING TWO IDENTICAL SECTIONS WHICH FORM EACH SIDE, FROM THE TOP CENTER INSULATOR RIGHT TO THE LOWER CENTER INSULATOR. IN OUR EXAMPLE, THE LENGTH OF WIRE REQUIRED IS 14.6 METERS WHICH IS DISTRIBUTED THE FOLLOWING WAY: 7.1 METERS FROM THE TOP CENTER INSULATOR TO THE TOP END, 40 CENTIMETERS GOING DOWN, THEN 7.1 METERS

TO THE LOWER CENTER INSULATOR. IN PRACTICE YOU WOULD WANT
TO HAVE A LITTLE LEEWAY SO THAT YOU CAN WRAP THE ANTENNA
WIRE AROUND THE INSULATOR AT BOTH THE TOP AND LOWER SECTIONS.
PLEASE NOTE THAT YOU WILL NEED TWO IDENTICAL HALVES TO MAKE
YOUR ANTENNA.

THE FIBERGLASS INSULATORS OR SPREADERS THAT SEPARATE THE
UPPER AND LOWER WIRES ARE TIED USING NYLON FISHING LINE.
IF YOU WANT TO USE THE TTFD FOR AMATEUR BAND TRANSMITTING
PURPOSES YOU MUST REPLACE THE 390-OHM TWO-WATT CARBON RESISTOR
WITH A NON-INDUCTIVE RESISTOR OF 390 OHMS CAPABLE OF
DISSIPATING AT LEAST ONE FOURTH OF THE TRANSMITTER POWER
ON THE SSB MODE OR ONE THIRD OF THE TRANSMITTER POWER IN THE
CW OR RTTY MODE. THE RESISTOR CAN BE ASSEMBLED FROM A SERIES
PARALLEL COMBINATION OF TWO-WATT CARBON UNITS. FOR A TYPICAL
AMATEUR BAND 100-WATT TRANSCEIVER THE RESISTOR MUST BE
CAPABLE OF DISSIPATING ABOUT 36 WATTS.
SOME NOTES ABOUT THE TTFD: THE TTFD ANTENNA IS ESSENTIALLY
AN OMNIDIRECTIONAL RADIATOR. IT WILL PICK UP LESS NOISE THAN
A RANDOM WIRE, A DIPOLE OR A VERTICAL, OUTPERFORMING THE
TYPICAL WIRE ANTENNA ESPECIALLY IN NOISY DOWNTOWN LOCATIONS.

IF YOU HAVE ANY DOUBTS, PLEASE FELL FREE TO SEND THEM TO
ME VIA E-MAIL. I'LL DO MY BEST TO HELP YOU ENJOY BETTER
SHORTWAVE RECEPTION WITH THE TTFD.

WITH MY BEST 73 S
YOUR FRIEND IN HAVANA
ARNIE CORO CO-2-KK

P.S. AS A 6:1 BALUN IS NOT A STANDARD ITEM, AND MUST BE BUILT,
YOU MAY WANT TO USE A 4:1 BALUN TRANSFOMER, AN ITEM THAT MAY
BE BOUGHT OF THE SHELF FROM AMATEUR RADIO SUPPLY STORES.
SPECIFY A BALUN RATED FOR AT LEAST 250 WATTS POWER, AND WITH
A 4 TO 1 RATIO. THEY USUALLY COME IN A WELL SEALED BOX WITH
A FEMALE COAXIAL CONNECTOR FOR THE CABLE AND TWO WIRES FOR THE
BALANCED CONNECTION.

FEEDING THE TTFD WITH THE TWO 75 OHM COAXIAL CABLE BALANCED
SHIELDED TRANSMISSION LINE DESCRIBED ABOVE, IS SOMETHING THAT
YOU WONT FIND IN THE TECHNICAL LITERATURE , BUT THAT IS AN
EXCELLENT LOW COST SOLUTION, AS THE 75 OHM COAX OF GOOD
QUALITY IS MUCH CHEAPER THAN ANY OTHER TYPE OF ANTENNA DOWNLEAD
DUE TO MASSIVE PRODUCTION FOR TV CABLE DISTRIBUTION SYSTEMS
THAT KEEPS COSTS DOWN I.E. ECONOMIES OF SCALE !
IN CASE YOU USE THE TWO COAX CABLE BALANCED , SHIELDED TRANSMISSION
LINE, REMEMBER TO CONNECT THE SHIELDS OR BRAIDS TOGETHER AT THE
TWO ENDS OF THE LINE, AND THEN SEAL THEM AGAINST MOISTURE,
ESPECIALLY THE END OF THE LINE THAT IS EXPOSED TO THE WEAHTER.
THIS APPROACH REQUIRES THE USE OF A BALANCED ANTENNA TUNER,
OR AS AN ALTERNATIVE A LOW COST 4 TO 1 BALUN AT THE ANTENNA

TUNER INPUT. SOME ANTENNA TUNERS HAVE A BUILT-IN BALUN SO IN
THAT CASE YOU WONT NEED AN EXTERNAL UNIT.
GOOD LUCK BUILDING THE KK-11 VERSION OF THE TTFD !!
ARNIE

I guesstimate about 10 meters in the air, with the highest point
at 5 meters and the lowest point at 2 meters. From there maybe
15 meters on the ground to a feedpoint w/ ground pin I had from
a previous antenna experiment.

So all in all, about 25 to 30 meters of antenna wire.

It's running straight between the trees, but from the low tree
to the feed point it goes "the long way around".

The philosophy behind that is that a bent piece of wire usually
outperforms a missing piece of wire ... it seems to work well
in this case because the random wire is good at exactly those
frequencies where the T2FD isn't ;)

El-cheapo 75 ohm TV coax. Probably not the best, but it is
available in many shops and cheap enough to just roll out
as many runs as will fit ;)

Btw, next time it's _your_ turn to cut the excessive quotes
from the email ;)

cheers,

2336. R75 Mods ver 2.1 Resistor value question

Yahoo group: icomr75 (2000 — 2002)
Date: 2002-08-27 15:13:35 UTC
From: curtis_cr
Topic: 2336 Message: 2336

I built up the 2.1 mod last night and am preparing to install it. I notice that R5 has a value of 1.1K. Since it's in series with a pot, I'm wondering is this value is right or if a standard 1k resistor wouldn't work as well. I put in a 1K resistor which I had lying around, but thought I'd better ask in case it's something else.

It's a great little speaker - the R75 sounds a heck of a lot better with it. It's bottom end spec prevents muddiness of sound. The regular price on this has dropped too! (used to be $39.95). It sounds better by far than my old RS SP-150 speaker that I have for my DX-160, too.

I designed v2.1. You should be fine with the 1k. You'll just lose a slight bit of adjustability on one end of the pot's range.

I chose 1.1k instead of 1k to center the pot around the desired threshold range.

John Gedde

<SNIP>
I built up the 2.1 mod last night and am preparing to install it. I notice that R5 has a value of 1.1K. Since it's in series with a pot, I'm wondering is this value is right or if a standard 1k resistor wouldn't work as well. I put in a 1K resistor which I had lying around, but thought I'd better ask in case it's something else.

Why not add a 100 ohm resistor in serial with the 1k?My 2 cents.

While on the subject of speakers ... I just ordered these from amazon.com (free shipping) to complete a surround sound system. However I will also test them with the R75 and then worry about priorities - surround, or shortwave? :-)

AudioSource LS100 50 Watt Indoor/Outdoor Speakers (Pair)
http://www.amazon.com/exec/obidos/ASIN/B00001OXQB

Price: $27.99 (for set of two)

The speakers are reviewed as having a "open midrange and warm tonal balance" using an "extra midrange driver" with 80 to 20,000 Hz frequency response, making them good for vocals.

Ok and thanks for the replies. I'll try it with the 1k and see what happens. I did think about adding the 100 ohm resistor in series AFTER I built it (total brain lapse), but wanted to make sure it wasn't a typo that really meant .1K. I can add it in anytime with relative ease. BTW, building it up was easy using a perf board - we'll see about the soldering!

Speaking of speakers. I purchased a 11x14 flat speaker, about 2 inches thick, from AmCom (they sell the Clear Speech speakers used by hams). The speaker originally sold for $149 and are being closed-out. I like it so much, I bought another. You can also find them via the internet for less. I have both connected at the R75 speaker jack and they sound great. I place the volume control less than half way running both speakers plus they are located under my desk. The speakers are made for wall hanging although you can place them elsewhere as I have. The company also sells prints that can be used in place of the covering already on them and they have an enormous selection. They are called Gekko speakers and come in larger sizes too, but heck, 11x14 is large enough unless you're placing them on a wall. They have a technology I don't fully understand. I have tried the Shack's RCA speaker but I had to place the volume control too high to receive adequate volume and didn't care for the clarity. Also better than my Koss amplified speakers which are now stored. They are manufactured by NCT (I think Noise Cancellation Technologies), the company that designed the Clear Speech speaker and NoiseBuster headphones.

They look like nice speakers - but the recommended minimum input power is
10W. Will the Icom 1W output drive them properly? Let us know...

2345. Sherwood SE-3 Mk III

Yahoo group: icomr75 (2000 — 2002)
Date: 2002-09-03 16:47:42 UTC
From: broadcast_dx
Topic: 2345 Message: 2345

After many years of wanting a Sherwood SE-3 Mk III, I finally placed my order this morning. I'll be using the SE-3 with the Icom R75 and Palstar R30C. I expect to see the most dramatic improvement on the Palstar since its ECSS capabilities are somewhat limited due to its rather coarse tuning steps, but I am confident that the R75 will also benefit greatly from the excelllent synchrous detection afforded by the SE-3.

I have looked through previous messages in this group and haven't found any reports from DX'ers who are actually using a SE-3 with the R75 although I would be very interested in any observations from list members who are using this combination but have not posted.

I'll be sure to post my observations to the list as soon as possible.

73,
Brandon Jordan

Topic: 2345 Message: 2347

Phil--

Sherwood has instructions for installing the BUF-3 buffer board in the R75 so I opted to install the board myself since I have experience working with electronic circuitry. I did ship my Palstar R30C off to them for the buffer board installation since they did not have instruction for this receiver but that should be resolved after the installation.

If you plan on using your SE-3 with multiple receivers you may want to consider Sherwood's matching switch box. I ordered the version that allows the SE-3 to be used with up to 4 receivers.

I am really expecting to have exteremely outstanding results with the Palstar R30C/SE-3 combo since the R30 is already such a great sounding receiver. For tough DX'ing situations I have usually opted for the R75 but expect that the R30 will be much more useful in those situations with synch. While ecss is possible with the R30, I found it to be less than satisfying due to the Palstar's rough tuning steps.

I've been wanting a SE-3 for many years now and am very excited that I am finally about to have one :)

2349. AM/MW - Three Foot Box Loop Antenna "KIT"

Yahoo group: icomr75 (2000 — 2002)
Date: 2002-09-03 22:09:35 UTC
From: radiohighfreq
Topic: 2349 Message: 2349

So for some reason, you can't build a K9AY 'outdoors' Loop for AM/MW DXing.
.
But you have thought about building an 'indoor' AM/MW Box Loop Antenna to use with your Icom R75 for AM/MW DXing.
Here is a "KIT" that has 'All' the Parts and Plans to do just that.
.
K5DKZ - Basic Three Foot Box Loop Antenna "KIT":
* This Three Foot Loop actually measures 33 inches on a side and stands about six feet tall from base to the top of the vertical spreader. The structure of the loop is an "X" Frame construction.
* The Main Wire Loop consists of 13 turns of stranded, insulated hook-up wire. A 365mmfd variable capacitor is used to tune the loop.
* A One Turn Pick-Up Loop is centered on the 13 turn loop and is held just inside the main loop.
* The Spreader Arms and wire combs are made from 1 X 5/8 inch clear, knot-free cedar.
.

What type of antenna tuners is everybody using, especially with longwires? I've been looking at various models by MFJ, and even old ones like the Yaesu FRT-7700 (which looks very good!). Anybody have an FRT-7700 for sale? :-)

Thanks

For you folks that use Mark Fine's Radio Listener's Database (RLDB) application with your R75, there is a new version just posted on his website at http:www.fineware-swl.com and there has been a significant speed improvement when loading the database and it is working flawlessly here.

For those that haven't taken advantage of this truly outstanding and FREE application, check it out! I'm not associated with Fineware, just a very satisified customer. :)

I use the FRT-7700 with my FRG-7700 and Kenwood R-5000. But I have
not tried it with the R75. What I like about the FRT-7700 is the
Extra AM/MW Band Filtering arrangement for both SW and MW DXing.
Check eBay a FRT-7700 shows up about once a month.
You could have had a Complete 'New in the Box' FRT-7700 from Sinapore
last month.

I think if you have a "raw" long wire (no baluns, no matching devices), the tuner should help a good deal.

See the MFJ-956 as an example:

2357. Re: Antenna Tuners

Yahoo group: icomr75 (2000 — 2002)
Date: 2002-09-05 22:18:42 UTC
From: radiohighfreq
Topic: 1650 Message: 2357

For me the FRT-7700 works better then the MFJ products I have used with the equipment I have and currently use. I like it for AM/MW Antenna Tuning (Peaking) and it works well on SW too.

.

The only way to find out and 'know' if an Antenna Tuner or Pre-Selector will work with your Receiver(s) and Antenna(s) setup is to 'borrow' of buy one and try it out for yourself with your equipment.

.

How To Test and Evaluate an Antenna Tuner's Effectiveness:

* Have your antenna directly connected into your receiver.
Tune and Log several stations on various bands and Log your S-Meter reading and Audio Quality (subjective).

* Install the Antenna Tuner between the receiver and antenna.
Follow the Antenna Tuners "Tuning" Instructions.
Tune and Log several stations on various bands and Log your S-Meter reading and Audio Quality (subjective).

* Compare the two sets of Logings.

? Are the S-Meter readings Higher?

? Does the Audio Quality sound better?

+ If the 'answers' to the two questions are 'both' YES:
Then the antenna tuner is working "Very Good" for you using your equipment. [Keep It / Buy One]

= If the 'answer' to one of the two questions is Yes:
Then the antenna tuner is working "fair" for you using your equipment.

- If the 'answers' to the two questions are 'both' NO:
Then the antenna tuner is working "NOT" for you using your equipment.
[Return It / Don't Buy One]

NOTE: About the S-Meter reading and Audio Quality.

* Some times the S-Meter reading goes Down, because the signal has less noise, but the over all Audio Quality is Better ~ The Programing is more Listenable.

* Most time the S-Meter reading goes Up and the Audio Quality is Better.

.

2359. DC Power Plug

Yahoo group: icomr75 (2000 — 2002)
Date: 2002-09-06 00:41:50 UTC
From: Bob
Topic: 2359 Message: 2359

Does anybody know of a source for a plug to fit the DC power jack? It is 6.5mm OD and 3.0mm ID. I want to make up a power cable to run the radio off a battery, but don't want to pay $12 plus shipping for a ready-made ICOM cable. I have checked all of the usual suspects (Radio Shack, Mouser, MCM) but can't find this size. Thanks.

Bob

Thanks. It does look very nice, but as you noticed it has 2 items
that I don't need (the receiver and the active antenna!). Having just
bought my Icom R75 + dsp + kiwa mods, I think I will not buy a new
radio in a while :-)

George,

I think RHF gave a very good reply to your question.

I would only add that any reasonable antenna tuner should be able to help AT LEAST in rejecting images and intermod, and making your listening experience a nicer one.

I am currently using a Sony AN-LP1 indoor loop + preselector/tuner with my Icom, with good results. Since the FRT-7700 is so hard to find, I may give the MFJ-956 a try, especially if I can get it locally or borrow it from somebody,

The object would be to buy the package and Check-Out the FRT-7700 and FRA-7700 with the R75.
.
Then "Re-Sell" the FRG-8800 and either or both of the two accessories you did not want.
.
I have seen the FRT-7700 and FRA-7700 go between $45 <$75> $115 on eBay.
The FRG-8800 by itself should go between $250 <$300> $375.
My new 'estimate of the 'Value' of the package on eBay is $340 <$450> $605.

Hey! That's not fair - we were all there once. I have never once welched on a bid, although one person ran off after I paid him (it was only $8, so no biggie).

From: broadcast_dx
Topic: 2368 Message: 2368

I'm not sure if you folks are familiar with the excellent ERGO control software, but I just have word from them that the next project after releasing v4 later this month is adding support for the Icom R75. This is a truly awesome control package, check out their web site at http://swldx.com

I've been asked to help test the alpha version of the R75 control module, so I'll be sure and keep the list updated.

Will definitely do.

On another note, I am still waiting for those $28 amazon.com speakers, which were supposed to have shipped "in 24 hours" 10 days ago!

Meanwhile I got a Radioshack PRO-X44AV speaker on sale for $30 which works beautifully.

From: Moxie3
Topic: 2373 Message: 2373

When not using the radio, I always unplug the power pack from the electrical outlet. I noticed that at the very instant when the power pack is plugged into the electrical outlet, the light on the radio's display flickers on for a split second. Has anyone else noticed this phenomenon? This happens even though the radio was turned off when the electrical plug was removed.

2375. Report on Ver 2.1 Mod

Yahoo group: icomr75 (2000 — 2002)
Date: 2002-09-08 00:39:47 UTC
From: curtis_cr
Topic: 2375 Message: 2375

I performed the 2.1 AGC/Sync mod to my R75 a few days ago as detailed in the schematic in the files section. I though I'd share my thoughts as to this mod since a lot of the messages I read related to earlier versions.

1. The mod is easy to build and cost me about $4 since I had to buy the perf board, chip and variable resistor - all at RS. I used seperated wires from an 8 conductor ribbon cable for the connection to the sync chip in the radio which turned out to be a good gauge and they are nice and flexible.

2. The soldering to the chip was not too bad but I had one of these magnifying "hats" which is very handy for close work. I secured the wires to one of the grey signal cables with black tape to secure them before soldering and this kept them from stressing the joints as the perf board is moved. Still, if you aren't comfortable with soldering, you could certainly damage things. I also found that setting the variable resistor to about the center of it's travel worked fine for me.

3. The sync now works MUCH better and I now use it by default on AM. It locks in on even weak stations. Phil's great guide implies that the SAM blinks when engaged, but mine is not blinking when locked and blinking when it's not. Mine stays locked from about -2.5khz down to about 3.5khz up from the target frequency so you can use it with the 1.2khz narrow filter detuning trick - which I like a lot.

4. Some of the earlier versions apparently whistled when locking, but this one locks almost instantly and does not whistle. At most you get a sound like a "beep". I used the 22k "high speed" resistor and it locks quickly. You can tune with SAM on and when you're on the correct frequency for an AM signal, it'll stop blinking.

5. Experimenting with signals with deep fade distortion in the audio, I've managed to find a few where I can engage SAM in the middle of a fade and the audio becomes almost instantly understandable. The fades are still there - but the audio no longer distorts. I've also found 2 or 3 signals where engaging SAM actually reduces the noise, but I really don't know why. It doesn't happen often, but when it does repeated presses of the AM key confirmed the effect.

6. The AGC fix is worth it by itself in my opinion. It makes for much slower AGC action and I frequently now use it set to Fast. If you turn the RF gain all the way down while receiving a station and

then bring it quickly back to full, you'll see the agc action on the signal strength meter. It sees to me to be timed very nicely now.

7. This didn't affect the overall audio quality - it's still not got a lot of high frequencies which makes it sound rather dull. I'm going to try some real time dsp sotware to see if a good multiband eq wouldn't help a lot with this. HIFI Audio quality is not a big deal to me, but it'll be interesting to see what happens.

I hoep some of you who are considering this mod will find this report useful.

OK, I have it now. That explains why the website search didn't produce anything. Thanks! I had been searching the printed catalog back in the AC adapter section. Silly me! I guess the lesson learned is to not assume like items will be together in the same catalog section. I am going to pick up a few packs myself for the same reason. Doesn't seem to be a commonly used size. Thanks again, Don.

George, Art,

I rather doubt it. All you are seeing is the processor -- which is still on and running -- reacting to the dropping voltage as the capacitors discharge. Lots of electronics will do similar oddball things when they are unplugged or running on low voltage.

(from rec.radio.shortwave, Author <alins@... (Ali N.)>, Message-ID: <51990af0.0209072046.3cc8201@...>)

buy.com is now taking pre-orders for the 2003 Passport to World Band Radio for $12.56 with free budget shipping (2-3 weeks). Availibility is said to be Dec. 2002, but the actual release will probably be in Oct/Nov. This is cheaper than Universal Radio, Grove, or amazon.com. Sales tax only in California, Indiana, and Massachusetts.

Type in the ISBN number (0914941836) in the search box and you will see it, or search for "Passport to World Band Radio".

great post!

> Phil's great guide implies that the SAM blinks when engaged,
> but mine is not blinking when locked and blinking when it's not.

:D... i am wrong (someone e-mailed me about this also)... i will need to change this in version 2 of my cookbook! i modded my sync and AGC now also (great mods IMO).

> Mine stays locked from about - 2.5khz down to about 3.5khz
> up from the target frequency so you can use it with the
> 1.2khz narrow filter detuning trick - which I like a lot.

actually there is another trick i do which i was going to add to version 2 of the cookbook... my numbers same as yours (these are probably due to 6 kHz filter asymetry).

1 - check both sidebands
2 - then engage Sync AM and 6 kHz filter!
3 - if LSB is better then shift (down) the frequency by about 2.5 kHz until sync is lost (blinking) then go back ~400 Hz [non-blinking].
4 - if USB is better then shift (up) the frequency by about 3.5 kHz until sync is lost (blinking) then go back ~400 Hz [non-blinking].

what i believe is happening is that half of the signal is being chopped off and leaving just the carrier and 'good' sideband. this can be very helpful as can the detuning by 1.2 kHz... please try the above and tell me if you have any luck. i've been meaning to post this for a while.

> it's still not got a lot of high frequencies which makes
> it sound rather dull.

i have a mod that i believe can fix all this... i've actually made several mods but have been really slow to report them. i'm going to try to crank a few of them out in the next few weeks as pdfs. i will release one tomorrow (hopefully) to get the ball rolling.

regards,
phil :)

It happens the same here. I think it is absolutely normal; the processor soft-offs the radio circuits with a little delay after the reset.

It happens the same here. I think it is absolutely normal; the processor soft-offs the radio circuits with a little delay after the reset.

Subject: [icomr75] 2003 Passport to World Band Radio for $12.56

(from rec.radio.shortwave, Author <alins@... (Ali N.)>, Message-
ID: <51990af0.0209072046.3cc8201@...>)

buy.com is now taking pre-orders for the 2003 Passport to World Band
Radio for $12.56 with free budget shipping (2-3 weeks). Availibility
is said to be Dec. 2002, but the actual release will probably be in
Oct/Nov. This is cheaper than Universal Radio, Grove, or amazon.com.
Sales tax only in California, Indiana, and Massachusetts.

Type in the ISBN number (0914941836) in the search box and you will
see it, or search for "Passport to World Band Radio".

2386. cancelling QRN

Yahoo group: icomr75 (2000 — 2002)
Date: 2002-09-08 18:17:34 UTC
From: Zacharias Liangas
Topic: 2375 Message: 2386

I wonfer if you find any good idea to cancel very strong QRN from nearby machines.

It is abt 4 months since a generator(?) is wiping out all low to medium signals with a S9 level across all bands. That happens with my 16m wigle wire antenna . I neaither know from hewre it comes

If i use two antennas and the MFJ1025 noise cancelling signal enhancer the problem is solved burt i prefer NOT to use two antennas as i need the true signal level to record.

Any ideas?

I'm using a Radio Shack 3 amp/13.8 VDC regulated power supply in place of
the Icom-supplied power pack. I see the same effect when I turn the
switch on the power supply on.

By the way, after turning the power supply off for a couple of weeks, I
found out that the R75's clock had stopped keeping time. The reason:
the clock battery inside the R75 had been drained because the clock had
been running on battery backup. It wasn't very expensive to replace the
battery, but this experience has led me to keep the power supply turned on
except when there's bad weather outside.

This occurrence is maybe more sinister than it appears.

I often operate my R75 on battery power. When the battery runs flat, the unit switches off. With the current drain stopped, the battery voltage increases, and the R75 turns back on, reducing the battery voltage and turning the R75 off. And so it goes on, in oscillation.

Not good at all for the R75, I'm sure.

I don't have the same problem with my SW77 or RV107 when the battery runs flat with them, they remain off.

There is clearly a problem in the R75 power circuit that makes it respond to power connection when it is off. I hear what sounds like a relay click when I press the power switch, so maybe a capacitor is keeping the relay energised too long? Anyone know how to remedy it?

Todd

2394. Antenna Weirdness

Yahoo group: icomr75 (2000 — 2002)
Date: 2002-09-09 11:34:52 UTC
From: Bill Brady
Topic: 2394 Message: 2394

Howdy Gang,
My R-75 seems to be less sensitive and is noisy compared to my M800.

I have a DX-SWL 60' sloper antenna. I'm not sure if this antenna acts more like a dipole or a longwire. It does have a so259 connector and I am using pl259s and RG59 downlead. I looked in the manual, and it shows a dipole hooked to the ANT1 and a longwire hooked to ANT2. The sloper is hooked to ANT1.

I have a piece of random wire running around the house just below the ceiling. Just for grins I hooked this to the "hot" clip of ANT2. It works better than the sloper! as good as the M800 on the sloper!

SO I am at a loss. I have been thinking of getting a pre-selector anyway: perhaps that'll allow me to use the sloper on the R-75???

Any thoughts?

Hi Gang,

I cannot figure out the dual passband tuning. The manual says "Variable range depends on the filter selection. =- 1.29 kHz in 15 Hz steps and =- 258 kHz in 3 Hz steps are available."

This whole section is gibberish to me.

First, what variable range is covered with what filter(s)?

How can 15 Hz steps over 1.29 kHz be read from the controls? That would be =-86 steps!

Next, why would 258 kHz be divisible by a smaller number, 3 Hz? (8600 steps)??

In any case, the controls seem to have little or no effect.

It's a typo. Should be 258 Hz for 86 steps.

The range of the pbt is limited and really only appears to be
effective with the narrow filters.

The way to deal with newbies (and oldies) of this sort is simply to
place your bid in the last minute. Requires diligence and discipline,
but it leaves no time to be outbid. (Or re-bid, so you really need to
decide how much you're willing to pay.

On the stock R75, the controls should have significant effect on USB/LSB signals (with their inherently narrow bandwidths) and a far lesser extent on AM, unless the narrow AM range is chosen. Consider that 1.29KHz or even 0.258 kHz is a sizable chunk of the 2.4 kHz bandwidth supplied for SSB, but a much smaller piece of either 6 or 15 kHz that one normally encounters with AM. The R75 was obviously designed with SSB/Utility users in mind as opposed to AM - and this total concept is probably the reason why the R75 is reviled as an AM radio. However, try using the PBT on AM narrow 2.4 kHz - you will certainly hear the type of variation you may expect. If you do this, it is IMO really important to have a good external speaker (which need not be expensive - old PC speakers or one of the $20 range RCA jobs from Radio Shack usually fill the bill).

Rest assured, if the rig is working properly, the dual passband tuning works exactly as it is described, and quite well at that. On pure SSB signals, such as most amateur voice comms, it is a wonderful tool for cleaning up signals in crowded bands. What really improves the operation on AM is Kiwa filter modification, which swaps out the 15khz filter for the existing 6kHz filter (most useful for FM, so it you like FM, don't do it), and adds a 3.8kHz filter in the vacated 6kHz slot which is very responsive to the PBT. Then, the PBT really shines on AM :-)

As far as the steps by which the PBT is adjusted are concerned, don't be too worried about this - in practice, the steps turn out to be smooth-sounding and appropriate, and work well.

Hi - I use an Alpha-Delta DX Ultra, which looks like two slopers strung together as a dipole. It works well on some bands, poorly on others (especially compared to my 65' wire). It has lately been getting weaker - I think, perhaps, due to the little gizmo in the center that supresses static wearing out.

In any case, I think the slope and height and direction of the sloper may be sensitive adjustments - I know the slope on my DX Ultra is critical, and I've found that the greater the slope (up to a point), the better the reception. Even a few degrees makes quite a difference.

If the power is cycling rapidly, that is a problem. If it goes off, then comes back on in the "off" state, i.e., power off, flicker, off, then it's probably not too bad. Certainly not optimal, but not "the sky is falling" bad.

> I hear what sounds like a relay click when I press the power switch,
> so maybe a capacitor is keeping the relay energised too long?
> Anyone know how to remedy it?

The relay click is unrelated. What you are hearing is a relay for the recorder remote jack on the front panel. If you turn the squelch (!) up so that the radio engages squelch, the relay will release. The idea is that a non-VOX recorder can be paused and un-paused by that squelch.

You can turn off the relay via a setup option. It was one of the first things I did. The R-8500 has the same arrangement and it clatters like an old teletype when scanning a busy memory bank, so turning it off was almost mandatory; when I got the '75, that was the first thing I looked for in the setup options.

Bruce, I asked as I also found my long wire as good or better than a dipole I'm using. I understand that a preselector/tuner would help.

On the stock R75, the controls should have significant effect on USB/LSB signals (with their inherently narrow bandwidths) and a far lesser extent on AM, unless the narrow AM range is chosen. Consider that 1.29KHz or even 0.258 kHz is a sizable chunk of the 2.4 kHz bandwidth supplied for SSB, but a much smaller piece of either 6 or 15 kHz that one normally encounters with AM. The R75 was obviously designed with SSB/Utility users in mind as opposed to AM - and this total concept is probably the reason why the R75 is reviled as an AM radio. However, try using the PBT on AM narrow 2.4 kHz - you will certainly hear the type of variation you may expect. If you do this, it is IMO really important to have a good external speaker (which need not be expensive - old PC speakers or one of the $20 range RCA jobs from Radio Shack usually fill the bill).

Rest assured, if the rig is working properly, the dual passband tuning works exactly as it is described, and quite well at that. On pure SSB signals, such as most amateur voice comms, it is a wonderful tool for cleaning up signals in crowded bands. What really improves the operation on AM is Kiwa filter modification, which swaps out the 15khz filter for the existing 6kHz filter (most useful for FM, so it you like FM, don't do it), and adds a 3.8kHz filter in the vacated 6kHz slot which is very

responsive to the PBT. Then, the PBT really shines on AM :-)

As far as the steps by which the PBT is adjusted are concerned, don't be too worried about this - in practice, the steps turn out to be smooth-sounding and appropriate, and work well.

Bruce Jensen
****

Thanks Bruce. I run the audio from both receiver through a regular Hi-Fi rig.

I'll give it a shot on single sideband stuff. I still have not figured which knob is which sideband and which way is up or down? Just gettin' too old I guess.

Thanks for the poop on the Kiwa mods, I'll pass on that.

Wm. "Bill" Brady, Harwood MD 38°51'30"N 76°41'00"W - Its in the darkest hour that the most stars come out.

2409. Add a 3 kHz Murata Filter for < $20

Yahoo group: icomr75 (2000 — 2002)
Date: 2002-09-10 00:53:13 UTC
From: just_rtfm
Topic: 2409 Message: 2409

hi everyone:

i put up a pdf file in my section on adding a 3 kHz 15-element Murata filter for AM. it does not work on SAM or SSB; however, it is pretty nice for MW tuning and listening. it has a mellow sound that is not apparent by its 3 kHz -6 dB spec. this filter addition does NOT require any soldering inside the R75. at the least the pdf shows a way to add other such filters without any soldering. wait for the electronics wizards' input before attempting yourself.

regards,
phil :)

2410. Sherwood SE-3 and issues with the R75 450/455 kHz IF?

From: broadcast_dx
Topic: 2410 Message: 2410

Is anyone on this list using the Icom R75 with a Sherwood SE-3 outboard synchrous detector? I just found out that there may be a slight issue with the dual 450/455 Khz that I will have to contend with.

UPS is delivering the SE-3 and buffer board tomorrow and perhaps there will be some documentation covering this issue included with the buffer installation instructions. I am curious if anyone the list is familiar with this issue and what I can expect.

If the power is cycling rapidly, that is a problem. If it goes off, then comes back on in the "off" state, i.e., power off, flicker, off, then it's probably not too bad. Certainly not optimal, but not "the sky is falling" bad.

Eric, the R75 switches off because the battery voltage has collapsed below 12V. Once the R75 is off (reduced current), the battery voltage recovers. The R75, now off, sees the 12V again and switches on again. The battery voltage drops below 12V and the R75 swicthes off. And so it goes on, and on, and on.

Surely the R75, once off, should remain off. If it is a soft switch, it is not held engaged physically, so there must be something that "holds" it on long enough to still be on when the voltage recovers.

Most electronics fail on switch on or switch off. This must be reducing the units life by a large percentage.

> I hear what sounds like a relay click when I press the power switch,
> so maybe a capacitor is keeping the relay energised too long?

The relay click is unrelated. What you are hearing is a relay for the recorder remote jack on the front panel. If you turn the squelch (!) up so that the radio engages squelch, the relay will release. The idea is that a non-VOX recorder can be paused and un-paused by that squelch.

You can turn off the relay via a setup option. It was one of the first things I did. The R-8500 has the same arrangement and it clatters like an old teletype when scanning a busy memory bank, so turning it off was almost mandatory; when I got the '75, that was the first thing I looked for in the setup options.

Yes it is. When you plug the power supply, the radio and particularly the processor is powered on and reset. After the reset the processor puts the radio in the state it was when the power was disconnected. The delay (due to the reset, startup of the processor's code, reading of the previous status from a non-volatile memory and execution of code to switch radio off) makes the display flicker.

Hi Phil!

Nice modification. However I find the segments of wire from a standard resistor is not wide enough. A small bend will make it fit better. I have tried this filter myself as well as the CFK455I, CFK455J and the CFJ455k8 from the Murata. They all behave very nice in the R75. These filters are optional for the AOR 7030 receiver. Nominal bandwidth is 4, 3 and 1 kHz but in real life they are a little wider. The CFK455J and CFS455J are closer to 4 kHz, perhaps 3,5-3.8 kHz and the CFK455I is about 5,5 kHz wide. The CFJ455K8 in my receiver has abandwidth of about 1,3-1,4 kHz and is nice for listening to NDBs with 1 kHz channel spacing (If you can't afford a CW filter). I bought 2 CFJ455K8 for 200 SKr = 20 US dollars.

I am planning to make a small board with two relays for the optional 455 kHz IF. Just need an extra switch. I will inform you when my modification is ready.

I don't think the R75 was designed to be used on batteries in this way. If it was, it would have a hysteresis circuit that required a greater recovery in battery voltage before it turns back on. I think it was designed to operate from an AC power supply, or a car where the battery (routinely) does not die.

Besides possibly shortening the life of the receiver, cycling the power rapidly probably also has the potential to corrupt the memory.

Pop... from the speaker? Or a relay click? I don't know what other
relays are in there -- I haven't opened mine in over a year.

One possibility is the antenna switch. Do you use the High-Z tabs on
the back? I don't, and if that's switched by relay, and the default
position is for the low-Z (coaxial) connection, every time you turn it
on that relay would energize.

2418. Initial report on R75/SE-3 Synchronous Detector

Yahoo group: icomr75 (2000 — 2002)
Date: 2002-09-12 00:45:25 UTC
From: Brandon Jordan
Topic: 2418 Message: 2418

I received the SE-3 and buffer board from Sherwood Engineering yesterday evening. The installation of the buffer required removing the main circuit board in the R75 in order to get underneath the board to solder a small coax connection to the 455 kHz IF coil. This coax goes to the input of the buffer and another short coax run was added from the output to a phono plug that I mounted on the rear panel by drilling a 1/4" hole. Two more connections are required to supply 12 vdc for the buffer. The entire process took 2 hours to complete and I would not recommend field installation for anyone who does not have experience working on electronic circuits.

So far, I am very impressed with the results provided by the SE-3. The synch is very quick to achieve lock and rock solid once obtained. Once the synch is locked on the carrier you can slowly detune above and below the frequency to increase audio clarity and frequency response and to reduce interference. On some signals I have been able to detune up to 2 kHz from the carrier and still achieve lock! The audio is just totally superb and I am very pleased with the SE-3.

The only issue with the R75/SE-3 that I can see is pretty minor. It appears that the wide bandwidth mode utilizes a 450 kHz bandwidth whole the normal and narrow modes are at 445 kHz. The SE-3 looses lock when switching from normal/narrow to wide and vice versa. I find this to be an extremely small inconvenience since it takes only one second to reinitiate lock by depressing the lock switch.

I'll be sure and post further observations after I get more hours at the controls under me belt. If anyone has any questions, please feel free to ask. I should have my Palstar R30C back from Sherwood early next week and am really looking forward to the R30/SE-3 combination.

"It appears that the wide bandwidth mode utilizes a 450 kHz bandwidth whole the normal and narrow modes are at 445 kHz."

This should read: It appears that the wide bandwidth mode utilizes a 450 kHz IF while the normal and narrow modes are at 455 kHz IF.

One further observation: The R75 NR/DSP/Notch functions have no effect on the SE-3 audio, although in my opinion the audio from the SE-3 is so impressive that they are not really missed here a notch function would be useful. The PBT function is functional, but when using narrow and medium bandwidths you have to go slow with the controls to not knock the SE-3 off lock.

Nice software, Bob. I appreciated very much the effort to make available all the R75 functions. But... I'd prefer to have all the commands on one window (the two windows don't fit in my 1024x768 desktop). The second issue is that there is not a bandscope as in RS-R75.

Simone,

Thanks for the suggestions.
You might try using the View --> Change font option to change
tk75's font to a smaller size. That makes the windows
smaller, too.

2426. getting rid of strong QRM (reception)

Yahoo group: icomr75 (2000 — 2002)
Date: 2002-09-15 10:19:07 UTC
From: Zacharias Liangas
Topic: 2426 Message: 2426

Dear frinds

During the recent period an unknown local QRM has been established/appeared in my area that produces a very high QRM level of S9+ 10 across all the SW bands in my 16m single wire antenna (a height of 5 m) .
My system is a reception only rig.
This noise seems to be a motor type, as using my receiver□s (R75□) Noise Blanker partially cancels this noise
I made another temporary antenna, a dipole of 2 x 13 m which unfortunately is on very low heights (only 2.5 m!) with cascaded wires of #14 for the first 6 m then 0.1 mm for the remain, with the one side over trees and the other standing over two TV cables .

QRM is still passed through this antenna, although in several bands the level is lower (e.g.
9 MHz) over a lower gain antenna regarding to the 16m wire . It is also nice that I use a MFJ
1025 noise canceller with the dipole as main antenna and the 16m wire as secondary.

MY problem is that using MFJ 1025 is very critical as changing to several kHz all sets change. And noise is not always 100 % cancelled

Does nay other have a better idea for canceling this noise with antenna only configuration or even if there is something I can put in side of the motor? (in case I find its owner)

Zacharias,

Have you ruled out a power line problem?

I experienced similar across-the-bands interference several years ago that was caused by a cracked ceramic insulator on a power pole in the alley behind my apartment building.

At first, the interference was intermittent. I finally noticed that it was worse during rain or high humidity. One evening while emptying the trash, I hear a faint buzzing sound, looked up and saw a blue arc on the insulator.

A week or so later, the QRM was constant in all weather conditions, and showed up as rolling "shot lines" on VHF television channels.

I telephoned Commonwealth Edison and within a few days, they sent a crew out, took the entire block off line, and fixed the insulator.

I'm not sure if this is what you're experiencing, but it might be worth checking.

Zacharias,
I too have the same problem, although my levels are considerably less. Mine is also from a bad insulator on a power pole on a nearby street. I have been fighting with New York State Electric and Gas for about 2 years now to get it fixed. What I have done that helps is to hang my wire as a terminated grounded loop with the interfering power lines off the side. I also use coax for the lead in wire. Make shure your radio has a good earth ground too!

Hope this helps,
Jim Reed

Zacharias,

1. Locating the QRM:
* Can this QRM be heard on a ordinary AM/FM Radio?
* Do you neighbors also have the same problem?
* Try using a portable SW Radio to locate the Source of the Noise.
* Walk a Grid Pattern for a half kilometer square and see is if you
can detect a location where the Noise is higher.

2. Low Noise Antenna Suggestion:
From the Association of North American Radio Clubs (ANARC) website
and Rec.Radio.ShortWave(NG).
Written by John Doty 26 Nov 1993

A Very Simple and Basic Low Noise SWL Antenna
* 50-75 Feet of 18 AWG Insulated Stranded Wire
* Height of Support Points 10-30 Feet.
* Bottom Feed Point for both Ground and Coax.
* Buried the Coax if possible.
* * Inverted "L" Configuration requiring two support points.
* * "Slopper" Configuration requires one support point.

=Quote=
* It doesn't take very much wire to pick up an adequate signal for
anything but the crudest shortwave receiver.
* The Difference between a mediocre antenna system and a great
antenna system isn't the antenna itself: it's the way you feed
signals from the antenna to the receiver.
* The Real Trick with a shortwave receiving antenna system is to
keep your receiver from picking up noise from all the electrical and
electronic gadgets you and your neighbors have.
=Un-Quote=

hi Payman:

> Can this mod be done to a Kiwa modified R75 as well?

yes... AFAIK Kiwa doesn't use the 455 kHz IF slot. the filter will
only work on AM (not on SAM). maybe more importantly you can use the
method described in the pdf to add any small filter to the unit.

Hi gang,
I have both an 8' and a 4' ground rod. I am getting cold feet about driving the 8'. I live on an ancient wave cut terrace (sand dune) and the ground is nearly 100% sand. What do I need to drive the 8' rod? All I have are 1 pound hammers and a 6 pound and an 8 pound maul.

I am worried about getting the 8' rod part way in. Has anyone driven an 8' rod?

Sounds like a piece of cake! I live in an area that's rock and packed clay. I didn't have any problem driving an 8 foot rod all the way in. I had to take 3 or 4 breaks along the way. In average, I'd say I gained an 1/8" for every smack of a 3 lb. hammer. As long as you keep banging on it, it'll keep going deeper!

I've got good 'ole Virginia clay and shale, making things hard for an 8'
rod. What I ended up doing was to dig a 3-4' hole a few feet away from the
house first, then drove the rod in the hole at the furthest point from the
house. This way I had no chance of hitting (and possibly cracking) the
footing.

Since I hit pure shale 6' down, this would have left an extra 1' of rod
sticking out. The hole allowed me to zig-zag the rod in place so when the
hole was filled in, it only left about an inch or two sticking out of the
ground and flush against the house. The hole also allowed me to connect the
cable sheild at a point that would be below the surface, making the whole
thing neat and mowable.

Yeah, forgot to mention that. All I did there was to carefully strip about an inch off the coax jacket to expose the shield. I then used coax sealing tape to initially strap it to the rod, and ensure that the shield and the connection wouldn't be exposed to wet ground. Then I used a small hose clamp to secure the coax to the rod around the sealing tape. I have a tendency to be "Cpt. Overtorque" when I tighten things down, so I checked that I wasn't bulging the tape too much through the clamp.

I like the idea of using the sealing tape because it isolates the clamp and shield/rod from causing any dissimilar metals problems down the road. Since it's all buried, there's no way to check if anything's rotting out down there, unless you start noticing excess noise on your radio. Better safe than sorry.

Also need to mention that if you do this, coax is cheap: make sure you leave about a foot-wide loop of excess coax before the connection and after the connection when you bury it. This gives you some excess, just in case you need to cut some cable and reconnect at some point. It also helps to trench and bury the cable leading to the antenna. It's a lot of digging, but it's worth it in the long run (so to speak).

After reading the Kiwa website, what they do is remove the 15 kHz 450 filter, put the old 6kHz filter in that slot, and then put the 3.8kHz filter where the 6 was. All 450 kHz filters. The remaining slot, which winds up being a narrow slot, is 455 kHz and available.

Phil's idea is an excell;ent one, BTW, if you are not going to get the Kiwa filter. With the Kiwa mod in place, though, I'm not sure why you'd want to put another filter in for plain AM, unless you are really fussy and want something else in between 3.8 and 6. The complement it has after Kiwa (2.4(9M) - 3.8(450k) - 6(450k)) is just about right.

There is also an available 9MHz slot awaiting your filter :-) I'd like to put in something wider there just for fun, to pep up SSB when the bands are clear.

I have clay soil with rocks, and I was afraid I would hit a rock, but I did not. I think I went about an inch per hit with a 22 ounce (600 g) hammer. Also, if you do get stuck, I believe you will be able to attach a set of vise-grip pliers and easily rotate it and pull it up. Finally, sand is a good insulator because it is basically ground up glass, drains quickly, and is not very acidic, so you *need* as much ground rod in the ground as you can get.

...
Finally, sand is a good insulator because it is basically ground up
glass, drains quickly, and is not very acidic, so you *need* as much
ground rod in the ground as you can get.

Hi Larry, thanks for the encouragement. At the moment the 8' rod is lost in the innards of UPS.

I understand what you mean re: sand. My only hope is that there is a fair amount of iron oxide in the sand.

8 Ft Ground Rod and Improving Ground Soil Conductivity.

You may wish to look at message # 2309.
* http://groups.yahoo.com/group/icomr75/message/2309

I like the "Idea" of using the 8 Ft Ground Rod and digging a two foot hole first. Use a Post Hole Digger if you can to dig out the hole. Plan to have the Connection (Head of the Ground Rod) just below the surface of the ground and Seal Wrapping the Joint. Plus leaving an extra 2-3 foot loop of ground wire buried under the ground in the hole.

Start the 8 Ft Ground Rod by pounding it in to the ground a foot or two more.

Next Add a Mixture of the following to the bottom of the hole:
* Epsom Salt (Magnesium Sulfate) 4Lb Box
* Blue Vitriol (Copper Sulfate) 1 Lb Box
Some people also like to add in
* Iodized Baking Soda (Sodium Bicarbonate) 1Lb Box
* Baking Soda (Sodium Chloride and Potassium Iodide) 1Lb Box
Helps to Salt the Soil (Ionize) to Improve Ground Soil Conductivity.

Then fill the hole with Clay Kitty Litter. (Sodium Bentonite) up to 4 inches of the surface of the soil. This 'Helps' to Retains moisture in the soil.
Make the Ground Rod and Cable connection and Seal and Wrap the connection.
Place one extra loop (2-3 Feet) of ground cable in the hole.
Top Off the hole with Clay Kitty Litter.

Water the Area very well.

Complete the job of Pounding the Ground Rod into the Ground.

Repeat watering the area every other day for about a week.

~ RHF

From: just_rtfm
Topic: 2409 Message: 2443

hi Bruce!

thanks for the compliment... this 3 kHz Murata sounds good on AM, better than the -6 dB specs would suggest. i made this mod before i did the Sync and AM AGC (Rado) mods... i agree that someone with the 3.8 kHz filter should pass on my mod. i posted it mainly for those not doing Dr. Rado's mods or wanting to know the mechanics of how to add a filter. don't worry... a mod that you will enjoy is coming.

regards,
phil :)

From: just_rtfm
Topic: 2448 Message: 2449

hello:

you're correct that the bandwidth need on SSB is approximately half that of AM. there appears to be practical limits to a SSB filter's size because they must attenuate the other side or flutter will result unless centered perfectly. one of the tricks in my Cookbook uses this fact to aid zero beating for ECSS.

i have done Dr. Rado's AM AGC and Sync-AM mods and i find that the audio quality (baring one-sided interference) is often better [more 'rich' sounding] on AM, probably as a direct result of processing by Motorola's AM Stereo chip on AM. actually there is another trick from the Cookbook i use to 'cut-off' one sided interference while using AM. i also find the AM audio to be louder with weak signals due to the chip's AGC... this prompted me to create the ECSS volume mod i recently released.

phil :)

If the filter is perfectly adjusted by the means of the PBT the answer is YES. PBT can be used like some kind of tone control.

George,

Modern Shortwave Receiver Survey (DXing.Com)
* The Yaesu FRG-7700 is at tha bottom of the web page has the Basic Information on the FRG-7700.
* The Used Equipment Price Range is $260 to $340.
* It has a Three Star Rating *** (Out of five stars max)
http://www.dxing.com/rx/frg7000.htm

eBay Auction "Completed" Items within the last 30 Days:
* Three FRG-7700s with an Average Closing Price of $220.
* Manuals for the FRG-7700 are available on eBay for ~$15.

IMHO: The FRG-7700 Receiver with the FRT-7700 Antenna Tuner and the FRA-7700 Active Antenna make a "Classic Looking Trio" A Complete SWL Radio Set-Up on a Desk Top. (Circa: Early 1980s)

However, Please Note: All three together do not equal my Icom IC-R75.

Well. It seems a lot of money for an USED antenna SWL tuner.

And I live in Europe where prices are high.
But some time ago there were several on Ebay (Germany)
that were sold for less than 100 Euros (if I can remember well).

If you go to http://www.aade.com/hampedia/prices2.htm1
you can see recent ebay prices and see that
the average final price for an FRT-7700 on Ebay US is $70.00 (USD).

So $175 is a LOT of money, even if you admit that Ebay final prices
are reasonable.

But, instead of the MFJ may I sugest a Mizuho AT2000 ?

119 euros at http://www.thiecom.de/at2000.htm
Or 143 Euros at Waters and Stanton (UK)
http://www.wslpc.com

At W&S they dont say the tuner is a Mizuho.

You can find more info about Mizuho at:
http://www.qsl.net/ku4qd/mizuho/

And the Mizuho KX-QRP tuner might also do a good job
for RX and might be more easy to find in the US.

Greetings
Paulo Ferreira

P.S.: I dont have any experience with the above material,
I have only read a lot of Web pages and postings,
and talked with some Hams, and all agree that MFJ is junk (most of the time).

Paulo,
I was able to see a picture of the Mizuho on the German site but I can't read German. But it looks like a quality tuner; is this tuner good for receiving with the R75 as I wouldn't use it for anything else? Also, I wasn't able to bring up the U.K. site, nor was I able to see locate information on the Mizuho site. Any other info would helpful, thanks.

Ok.
Sorry. The UK site should be http://www.wsplc.com/

Now here is the altavista translation into English, because I also dont
speak German:
==========
Description:

So that your receiver and your antenna can co-operate optimally, it can be
often necessary that the antenna is adapted correctly. The global (Mizuho)
AT2000 covers the range from 100 kHz to 30 MHz. The AT2000 has also over a
low-pass filter, as well as " a Q " - switches, which QRM disturbances fade
out can. (nearly) all antenna systems can be adapted. A genuine classical
author!

Plan conclusions

Mass: 150 x 67 x 146 mm

Weight: approx.. 300 g

Characteristics:

" Q - switches against disturbances ", low-pass filters

George,

Sorry, when I read the $175 price, I 'assumed' your were taking about the "FRG" 7700 not the FRT-7700. The FRT-7700 has gone from $40 to $100 on eBay with $65-80 being the average price.

The FRT-7700 has both extra filtering for MW and SW. I have two of them. Use one with my Kenwood R-5000 and the other sits on a deck top with my FRG-7700 and FRA-7700. The FRT-7700 has two antenna inputs (SO-239 & Snap Terminals) and two antenna outputs BC(MW) and SW. I prefer the FRT-7700 to several MFJ Products that I have used.

I hope to have a Palstar MW550P soon.

>George

No.

But the picture of the "AT-2000 GLOBAL receiver ATU" that WSPLC
carries and has on their web site:

Under Products -> antenna tuner units ->receiver ATUs

Looks like the Mizuho At-2000 picture at thiecom, and has the same buttons,
size and weight. So I presume that it is a Mizuho on diguise.

Thiecom refers to the tuner as a "Global (Mizuho)" tuner.

But wait there are two shops on England that have "GLOBAL"
At-2000 atu for sale used:

http://www.radioworld.co.uk/used9s.htm

http://www.jayceecoms.com/used_equipment.htm

Greetings

Paulo

P.S.: Some R75 content: Here the R75 is "cheap" at $885.00 USD,
compared to the $831.00 USD of the FRG-100 or
the $1071.00 of the VR-5000.

>products but not the AT2000. I am still awaiting a response from the
>German company. Are you aware of anyone else who carries the Mizuho
>AT2000?
>George

No.

But the picture of the "AT-2000 GLOBAL receiver ATU" that WSPLC
carries and has on their web site:

Under Products -> antenna tuner units ->receiver ATUs

Looks like the Mizuho At-2000 picture at thiecom, and has the same buttons,
size and weight. So I presume that it is a Mizuho on diguise.

Thiecom refers to the tuner as a "Global (Mizuho)" tuner.

But wait there are two shops on England that have "GLOBAL"
At-2000 atu for sale used:

http://www.radioworld.co.uk/used9s.htm

http://www.jayceecoms.com/used_equipment.htm

Greetings

Paulo

P.S.: Some R75 content: Here the R75 is "cheap" at $885.00 USD,
compared to the $831.00 USD of the FRG-100 or
the $1071.00 of the VR-5000.

Wow, I guess we have it lucky here. The R-75 is about $500-600 new or used (which tells you how good they really are). The FRG-100 is about $300 used (I got one used for about $270, but sold it soon after, it's not in the same league as the R-75) and the $700 VR-5000 is not really an HF receiver, it's one of the DC to daylight receivers that doesn't do anything great, just a lot of things pretty good.

2464. ISO: Spectrum Analysis software for the R75

Yahoo group: icomr75 (2000 — 2002)
Date: 2002-09-26 19:21:47 UTC
From: Brandon Jordan
Topic: 2464 Message: 2464

I am looking for a software application for the R75 that has a spectrum analysis funtion similar to the one implented in the NRD.exe software for the JRC NRD-535 receiver. So far I have been unable to find a application that handles this procedure in the same method.

In the NRD.exe software, during each sweep the program took a configurable number of readings at each frequency step and plotted them on a graph much like the current applications that I have seen. The difference was that instead of plotting a new graph on each subsequent sweep, it would actually take the new signal readings and average them with the readings from the previous sweeps. This made it possible to watch for weak and fading signals that were barely above the noise floor that could easily be missed with software that plotts a fresh graph each sweep. For example, this method was particularly useful for monitoring the tropical bands and viewing the African carriers rising above the noise floor in the late afternoon. New or unique carriers were easily discernable after becoming familiar with the bandsweeps.

Is anyone aware of any software available for the R75 which handles the spectrum analysis routine in this manner?

73,
Brandon Jordan - Memphis TN - bjordan@... - http://www.bcdx.org
Receivers - Icom IC-R75 - Palstar R30C - Sherwood SE-3
Antennas - Quantum QX Pro - Wellbrook ALA 330 / K9AY

From: just_rtfm
Topic: 2464 Message: 2465

hi Brandon:

i am beta testing a program which is a type of spectrum analyzer for the R75. my program processes sound card input and can detect AM signals so faint that you may have to listen for a while to realize they are there. as i am unfamiliar with NRD.EXE, please e-mail me at just_rtfm at yahoo dot com. i am curious what specific frequencies you are scanning and how you used that program. thank you.

as not to tick anyone off in the Palstar group for being off-topic: you may want to do these mods before you compare AM: Dr. Rado's AM sync & AM AGC fix plus Pete's 0.07 uV MDS MW mod... i also have a mod coming soon that will further enhance the R75's AM audio.

phil :)

Hello George

I have the Global Coupler AT-2000 and it appears identical to the Mizuho per the url you suggested. On the back of the AT-2000 there is a small sticker "Made in Japan for Waters and Stanton Electronics". Most likely made by Mizuho with a different label of "Coupler AT-2000" on the front.

This atu really works from below the mw band right on up to 30 MHz.

Hi again,
David, that German site shows a frame that is entirely dark grey, front top & sides. Also, it looks as if the Mizuho is a 1 piece frame consisting of the front, top & sides, while the Global seems like it is 2 pieces, a separate front panel and the top & sides being the other piece. Is this what you see or am I not seeing something? I hope you don't mind me asking as I know I'm splitting hairs here but I'm curious.

2473. Re: [icomr75] Mizuho AT-2000

Yahoo group: icomr75 (2000 — 2002)
Date: 2002-09-29 15:34:30 UTC
From: David Ross
Topic: 2466 Message: 2473

Hello George

I see the same as you. W&S shows a dark grey front panel with a tan case and the German page shows a dark grey front panel with a lighter grey case. Both urls show 2 screws on each side at the bottom that fasten the outer case to the chassis.

2476. Re: [icomr75] Mizuho AT-2000

Yahoo group: icomr75 (2000 — 2002)
Date: 2002-09-29 17:13:48 UTC
From: Moxie3
Topic: 2466 Message: 2476

David,
I had thought I placed my order with the German company until I received their confirmation information. The confirmation instructed for me to place a wire transfer which costs $40. This is why I'm thinking of buying the tuner elsewhere. However, the cost at the German site is about $130 shipped plus cost of transfer. I'll see if they will accept an International Postal Money Order instead. If I calculate the exchange rate correctly, the UK site has it for $140 plus shipping with no other costs since they accept credit cards. Regardless, I'll buy from someone this week as it looks like a well-made tuner. If I decide to go with the German site, I hope that the instructions are not in German.
Regards,
George

2477. Re: [icomr75] Mizuho AT-2000

Yahoo group: icomr75 (2000 — 2002)
Date: 2002-09-30 17:17:41 UTC
From: Moxie3
Topic: 2466 Message: 2477

David,
Since I never used an ATU before I have a question: Do you have to retune the ATU every time you change frequencies?
George

2478. Re: [icomr75] Mizuho AT-2000

Yahoo group: icomr75 (2000 — 2002)
Date: 2002-09-30 20:53:46 UTC
From: David Ross
Topic: 2466 Message: 2478

George

Yes, every time you change frequencies whether in the same band or another, you need to tweak the controls to maximize the received signal. You are matching the impedance of your antenna to the received frequency. That way you get maximum signal transfer.

2479. Re: [icomr75] Mizuho AT-2000

Yahoo group: icomr75 (2000 — 2002)
Date: 2002-09-30 22:01:30 UTC
From: Moxie3
Topic: 2466 Message: 2479

David,
Would you say that by using the tuner, you receive maybe 10% or so more stations?
George

2481. Re: [icomr75] Mizuho AT-2000

Yahoo group: icomr75 (2000 — 2002)
Date: 2002-09-30 23:32:46 UTC
From: Moxie3
Topic: 2466 Message: 2481

David,
Sounds good to me. I've got an e-mail in to the German company asking whether they'll take a certified check in U.S. dollars as I can't get one in Euros. Also, effective August 10th, the postal service has stopped International Postal Money Orders to Germany. The only way I can send them the money in Euros at this time is a wire transfer which costs $40. And this company takes sooooo long to get back to me, usually about 2 or 3 days. So I'm hoping that they will accept pre-payment via certified check so I can get things going. I don't understand why they don't take credit cards like most other companies but so be it. BTW, I've been told that Mizuho hasn't made the AT-2000 since the 90s - don't know how true this is and it doesn't matter to me.

George

Date: 2002-10-01 00:34:36 UTC
From: Moxie3
Topic: 2466 Message: 2482

David,
Good news. The German company said they will take a certified check in dollars; I'll mail it out tomorrow.

2483. Magnetic Longwire Balun

Yahoo group: icomr75 (2000 — 2002)
Date: 2002-10-01 01:21:17 UTC
From: payman_a
Topic: 2483 Message: 2483

Is anybody using a longwire with a Magnetic Longwire Balun (of the type in RF Systems MLBA-MK1 antenna for example), or can somebody comment on the usefulness of an MLB vs. an external antenna tuner?

Reference: see the thread "Magnetic Longwire Balun" (MLB) -- Impossible claims?" on http://groups.google.com.

Thanks!

payman

2484. Re: [icomr75] Magnetic Longwire Balun

> Impossible claims?" on http://groups.google.com.

Controversial subject. Not any matching transformer, per se, but the
RF Systems product.

The Magnetic Longwire Balun is three lies for the price of one:

Magnetic? No, electromagnetic.

Longwire? No, usually used on a random wire.

Balun? No, either an unun or a matching transformer. Baluns are for
balanced to unbalanced connections, like a dipole to coax.

Now, using a matching transformer on a random-wire is a good idea. The
antenna is generally high-impedance, and your coaxial line is low-impedance.
At various frequencies, the impedence will change, but the transformer
will "smooth" things out for you, making the impedence mismatch much smaller
to the receiver, and improving on received signal transfer to your radio
where you want it.

That's one of the reasons for using a matching transformer, and the
explanation, to put it mildly, is very fast-and-loose. A pedant would
positively blow a gasket at it, but it'll do. Anyway...

Another benefit of using a matching transformer to feed your random
wire is that it moves the antenna away from your house, and away from
all the noise sources there. IF YOUR MATCHING TRANSFORMER IS GROUNDED
AT THE ANTENNA FEEEPOINT, which the MLB does NOT do, noise from the
inside of the house won't "get" to your antenna via the coax.

The third point is that a random-wire antenna will tend to pick up a
static charge from wind blowing across it or rain and snow -- especially
snow -- falling on it. Since the transformer is a short at DC, the charge
on the wire will be constantly bled off. While the R-75 has an
internal resistor for just that purpose, this is safer by an order of
magnitude.

What I would suggest is that you consider an ICE matching transformer
instead -- specifically the ICE 180 or one of its cousins.

They are designed to be grounded at the feedpoint, and that should be done -- it's important. The "MLB" doesn't allow for that.

They have gas-tube protection that will save your R-75 from lightning near-misses.

They are better constructed. They're also not potted in epoxy so you can open the case and look at the "guts."

They have multiple impedence taps so you can find out what works best, in case the standard 9:1 transformation isn't the best for your antenna.

They are cheaper!

Finding them can be a hassle, though. Cable-X-Perts (www.cablexperts.com) carries them, IIRC. ICE's website is not active at this time. I'll have to look at home to find out where I bought my last one, earlier this year. (I didn't get my ICE-182 from Cable-X-Perts because they didn't carry that specific variant.)

Eric is right on. I took Eric's advice and bought one of ICE's products, a coaxial lightning/EMP suppressor - exceptional quality at a fair price. And that ICE 180A has great reviews. And for once I can add something to this site: You can reach ICE at 1-800-423-2666.

Hi, George,

Good to hear that it turned out well.

I keep forgetting to ask -- how do you like Joe Carr's antenna book?

(Posted to list because it may be of general interest.)

Eric,

I'm embarrassed to say but I've read just a few pages, specifically about long wires, random wires and a few other subjects. I need to read it from beginning to end - it's an excellent book. The only place I found it in-stock new was at Barnes & Noble online.

Eric, while you're here, I've got a question. Putting aside grounding, static electricity, RMF, noise issues, etc., is there an advantage with using coax to the receiver vs. using the spring loaded clips? I was thinking more with reception. Doesn't the receiver adjust the impedance at the spring loaded connectors?

Oh, for Payman, I forgot to pass along yesterday that the 180A (1.5-30Mhz) is $39, and ICE only charges for actual shipping. My shipping charges, which included some cable, was $4.30 from IN to FL. The 182A (.1-30Mhz) which Eric mentioned is also $39.

You sure are putting a lot aside! :-)

>is there an advantage with using coax to the receiver vs. using the spring
>loaded clips? I was thinking more with reception. Doesn't the receiver
>adjust the impedance at the spring loaded connectors?

There is a small unun in the R-75 to present high impedence at the spring
clips.

The main purpose of coaxial line is to bring RF from or to an antenna
somewhere else. So most of the purpose of coax is to get the signal
to and from that point as unmolested as possible. Coax does have losses,
however, so if you don't need to move the antenna away from your radio,
it doesn't make a difference. However, for the discounted reasons above,
plus others if you transmit, coax -- or some other transmission line --
should be used to get the signal from your antenna to the radio.

Phil's wire 'round the room is an example of where coax would *not* help.

Obscure fact o' the day: The RG- prefix on coaxial lines stands for
"radio guide" and dates back to the early, dark ages of coaxial cable.

Obscure fact #2. Other transmission lines like 300 ohm twin-lead or 450 or
600 ohm ladder line are balanced examples of wire lines. I do a lot of
"playing with radio" on a site used for RF testing, the Table Mountain
National Radio Quiet Zone. You find odd things out there; one I found
was *unbalanced* wire line: 4 wires surrounding a 5th central wire, held
in place by the supports every few feet (and presumably by ceramic or
Bakelite spacers on the wire itself, but the wires were gone; just the
supports with their spacers were left).

>
>
>Oh, for Payman, I forgot to pass along yesterday that the 180A (1.5-30Mhz)

>which Eric mentioned is also $39.

BTW, the difference between the 180 and 182 is that the 182 has a higher-
cpacitance isolation capacitor. The 180 has 0.01 uFd; the 182 has, I think
0.5 uFd.

2491. can I adjust the bandwidth by PBT

Yahoo group: icomr75 (2000 — 2002)
Date: 2002-10-02 08:38:15 UTC
From: januaryabc
Topic: 2491 Message: 2491

Someone said that the effective range of PBT is +/- 1.29khz when
2.4khz filter is selected, is it true?

If it is true, can I adjust the bandwidth by PBT ?

If yes, what is the range of bandwidth that can be adjusted by PBT?
(Is that from 0.11khz to 3.69khz)

Will there any differents in performance compare with a true filter?

2492. Re: can I adjust the bandwidth by PBT

Date: 2002-10-03 01:28:01 UTC
From: just_rtfm
Topic: 2491 Message: 2492

hello:

> If it is true, can I adjust the bandwidth by PBT ?

yes! the range from what i can see via spectral analysis is about 400 Hz to 2400 Hz range. while i am sure a dedicated filter could offer better performance, i believe that most people do not need optional filters. the stock filters are quite good, especially if you know all the tuning tricks (see the cookbook in the files section).

phil :)

2493. another low cost filter method

Is that I can get narrower bandwidth only, not wider?

2495. Re: can I adjust the bandwidth by PBT

Yahoo group: icomr75 (2000 — 2002)
Date: 2002-10-03 16:11:50 UTC
From: analogger2001
Topic: 2491 Message: 2495

> Is that I can get narrower bandwidth only, not wider?

This is true, but if you tune in a station in the narrow mode with the 2.4 Khz filters selected for both passbands, you can take both PBT controls and turn them the same direction. In effect you are selecting one sideband or the other. This gives more bandwidth to the sideband you select, and thus more high frequency audio. Also you can pick the sideband with the best audio. This trick works best in S-AM mode, but will work in Narrow AM mode also.

Jim

2496. Buying An Icom IC-R75, keep my FRT-7700 tuner?

Yahoo group: icomr75 (2000 — 2002)
Date: 2002-10-03 23:31:11 UTC
From: gerryhaughey
Topic: 2496 Message: 2496

Hi all, i am considering buying a new or used icom ic-r75 receiver some time soon and getting rid of my ageing FRG7700. With the FRG7700 i have the additional FRT7700 antenna tuner, do you guys reckon this tuner will work with my Icom when i get it, and if so is it worth holding on to it?

Any feedback would be much appreciated. Really looking forward to getting my new icom! Oh and one more thing what would be a good used price(in euro's) for a Yaesu FRG7700 with the FRG7700 VHF convertor?

2497. Re: [icomr75] Buying An Icom IC-R75, keep my FRT-7700 tuner?

From: Moxie3
Topic: 2496 Message: 2497

Gerry,
No way, get rid of the FRT-7700 tuner; I'll do you a favor and take it off your hands plus give you 5 bucks for it. Just kidding! If you read some of the more recent posts on the FRT-7700, you'll see that it is a highly respected and high in demand tuner by owners of the R75.

Subject: [icomr75] Buying An Icom IC-R75, keep my FRT-7700 tuner?

Hi all, i am considering buying a new or used icom ic-r75 receiver some time soon and getting rid of my ageing FRG7700. With the FRG7700 i have the additional FRT7700 antenna tuner, do you guys reckon this tuner will work with my Icom when i get it, and if so is it worth holding on to it?

Any feedback would be much appreciated. Really looking forward to getting my new icom! Oh and one more thing what would be a good used price(in euro's) for a Yaesu FRG7700 with the FRG7700 VHF convertor?

Keep the tuner. It will work well with the R-75.

Before you get rid of the FRG-7700, do a side by side comparison with the R-75 and FRG-7700. You'll be sorry to leave that beautiful sound of the FRG-7700, but not all is lost. Go to Radio Shack (if they have those in europe) and get yourself an RCA Pro-X33A speaker while it is on sale for $20, not when it is at its regular price of $40 (about every other month). Then do the comparison between the Yaesu and Icom. You'll see that you are just about there and you'll have the added benefit of a modern receiver with DSP (get the DSP option, it's worth it, but mostly for getting rid of heterodynes).

Here's another suggestion, keep the FRV-7700. Make a copy of the pinouts for the accessory connector of the FRG-7700 and you can wire up a wall-wart power supply to power up the FRV-7700 without plugging it into the FRG-7700. Then you can feed the R-75 with the down-converted signals and make you R-75 capable of hearing aircraft, 2 meter ham and 150MHz radio communications!

A good, clean FRG-7700 should fetch about 250-300 euro/usd on ebay. If you have the original boxes and especially the original manual, you should get closer to the higher number, maybe more. I got one for $250 on ebay and a year later, after I got the R-75, sold it for the same price. So for about $15 in shipping and ebay charges, I got to "rent" the radio for a year; not a bad deal :)

Good luck,
Roy

[R] Currently the US Dollar and the Euro are about on 'parity'?

Modern Shortwave Receiver Survey (DXing.Com)
The Yaesu FRG-7700 is at tha bottom of the web page.
The Used Equipment Price Range is $260 to $340.
It has a Three Star Rating *** (Out of five stars max)
http://www.dxing.com/rx/frg7000.htm
Read the Basic Information on the FRG-7700

eBay Auction Completed Items within the last 30 Days had Three Yaesu FRG-7700s with an Average Closing Bid/Price of $220.

The three major accessories for the FRG-7700 Receiver usually have a Closing Bid near $70-$85 with a range of about $45 to $135.
FRT-7700 Antenna Tuner
FRA-7700 Active Antenna
FRV-7700 VHF Convertor (Some What Rare?)

NOTE: 'Original' Manuals and Documents; Plus the 'Original' Boxs Add to the Price Valuation of Any Item For Sale at Auction.

2501. Icom FL-103 9MHz (2.8kHz) Filter

Yahoo group: icomr75 (2000 — 2002)
Date: 2002-10-07 18:33:42 UTC
From: R H F
Topic: 2501 Message: 2501

Let me verifiy something concerning the Icom FL-103 9MHz SSB Wide Filter. This Filter is a Plug-In Unit - Right?

I bought this R75 on eBay and it already had all the Kiwa Mods (Including the 455kHz Filters).
So, Installing the FL-103 Filter would give me an additional filter in the 9MHz IF Section.
Would this FL-103 (2.8kHz) be a better third 9MHz Filter option then the Narrow SSB FL-223 (1,9kHz) Filter?

~ RHF

2502. Re: Icom FL-103 9MHz (2.8kHz) Filter

Topic: 2501 Message: 2502

hi RHF:

AFAIK all the ICOM filters are plug-in. some friends of mine have told me that the 2.8 kHz filter is the 9 MHz position is excellent for ECSS. the narrow 1.9 kHz filter would maybe be fine if you are always parked on hams BUT IMO it's not worth it because you can turn the PBTs in opposite directions and easily simulate this filter. have you read my cookbook? the reason i ask is that IMO additional filters are rarely needed. if you want to simulate sideband selectable sync... do this trick: using the 2.4 kHz filters detune by plus or minus 1.2 kHz while using S-AM. try it out tonight. find an AM station where there is one-sided noise, compare the two using USB and LSB. if LSB is better then decrease the frequency by 1.2 kHz, if USB then increase. for example: if you want 600 kHz AM but the LSB is noisy... engage dual 2.4 kHz filters, engage S-AM, and then tune to 601.2 kHz. the audio will brighten.

phil :)

There is also a 3.3kHz filter, FL-102 I think, that works very well for ECSS, and gives you a little more bandwidth than the FL-103. If you're going to spend the money that would seem to be more useful since you already have the 2.4kHz filters.

LR,

I looked in the manual and there is not FL-102 listed for the R75 is it used on another Icom RX? or TX? And will it work in the R75?

There is a FL-257 (3.3kHz), but it is for the 455kHz 3RD IF.

What I am looking for is a third filter for the 9MHz 2ND IF. Would really like a 6kHz, but a 3.5-5kHz would do. Maybe when KIWA gets relocated; I can pose the question of a 9MHz 2ND IF 6kHz Filter to them. Or then again, INRAD may wish to take on the task.

I'm sorry. I WAS thinking of the 455kHz 3.3 kHz filter. That's what
I get for talking off the top of my head. You are correct; the
widest optional 9MHz filter is the FL-103 2.8 kHz filter.

The 6 kHz FL102 is used in several ICOM transceivers and is a direct plug in for the R75.

-I have the same condition with my r75, (2 yrs old). Being a tech I opened the case and found the source of the heat, a 7805 voltage regulator. There is a 12 ohm resister in series with the regulator, this resister act as a current limiter (both run hot).I emailed Icom and their response was to send it in for service. I have not noticed any operational defects (works fine). Has anyone else noticed if their receivers run warm after 30+minutes?

I don't know of any review but I know it is used in the IC765 tranceiver and I was recommended this filter by the a technician at the Swedish ICOM representative who has also in some way been involved with the construction of the R75. He told me it was hard to convince them that selectivity should be independent of mode and that the 69 MHz IF should be much tighter than the actually used. He also recommended me to switch the 2 pole x-tal filter ahead of the noiseblanker to a 6 kHz filter used in some tranceivers.

> Phil's wire 'round the room is an example of where
> coax would *not* help.

Eric is correct: moving the R75 away from my computer equipment was somewhat effective. the R75 is so sensitive that 50' of wire inside the house is a decent antenna signal-wise; however, the big problem still remains: household electrical noise. after spending some time reading up on antennas i came to the conclusion that the best indoor antennas are of loop design. loops are directional (moreso on MW than SW obviously) and loops respond to the magnetic component of radio waves as opposed to the electrical component (where most of the house generated noise resides). loops can be directional with regards to household noise: noise can be minimized or nulled. the result of using loops: quiet indoor reception. i now have both SW and MW loops.

here are my recommendations for SW reception:
outdoors with room: random wire
outdoors without room: wellbrook loop (or equivalent homebrew)
indoors: torus tuner loop (or equivalent homebrew)

http://www.wellbrook.uk.com/ALA330.html
http://www.torustuner.com.futuresite.register.com/_wsn/page2.html

here are my recommendations for MW reception:
outdoors with room: beverage array
outdoors without room: K9AY loop (or equivalent homebrew)
indoors: Quantum QX loop (or equivalent homebrew)

http://www.hard-core-dx.com/nordicdx/antenna/loop/k9ay/
http://www.dx-tools.com/QX.htm

this site has more information about loop antennas:
http://www.hard-core-dx.com/nordicdx/antenna/loop/index.html

i am not an expert on antennas so if you have better recommendations or comments, let them be known!

regards,
phil :)

Some Thoughts On:
Full Room (Perimeter) Loop Antenna Options.

1. If you are running a Single Turn Full Room (Perimeter) Loop Antenna at or near ceiling level you can use 5-8 Feet of TV Twin Lead as a FeedLine to the R75's High-Z Terminals; vice using a piece of coax or speaker wire for the feedline.

2. A Two Turn Full Room Loop Antenna: One Turn at the ceiling level and One Turn at the floor level; with a Vertical Crossover Leg between the top and bottom loops. Again use TV Twin Lead as a FeedLine. Normally both loops in this set-up would run in the same direction. But if you have allot of Noise in this configuration try running the loops in opposite directions; sometimes this works to reduce noise.
NOTE: This two turn loop mite work well very with an Antenna Turner / Pre-Selector.

3. Adding a 390-Ohm Resistor in the Vertical Crossover Leg could transform this into an In-The-Room "T2FD" (BroadBand) of sorts. Or use a 5K Ohm Audio Taper Potentiometer to Adjustment for the "best" signal at various frequencies.

4. Another In-The-Room Loop Antenna Option is a "Whole Wall" Loop Antenna: Using one of the above set-ups in an attempt to gain some Directivity (N-S -or- E-W) with a Fixed Loop. These types of Whole Wall Loops can be made of a single wire, Speaker Wire, TV Twin Lead, or 3-5 Conductor Flat TV Rotor Cable.

From: jmpickrelljr
Topic: 2513 Message: 2513

I have been reading the exchange on the R-75 filter settings with interest.

I am a Newbie to both the Group and the R-75 and while I've followed the questions/answers I'm not sure I understand everything I've read.

At this time I would like to know:

-what are the units represented by the numbers 2.4/15(KHz/MHz?),

-what would be "typical" settings for "normal" listening (mostly SWBC stations and periodically hams on sideband)and, finally,

-the manual does not seem to give recommendations (an observation).

Thanks,

John Pickrell
Punta Gorda, FL

hi John:

the filter bandwidths are in kHz... typical settings for SSB are 2.4 kHz & 2.4 kHz... and for AM are 15 kHz & 6 kHz. if you're new you may want to download my R75 Cookbook (PDF) in the files section under the directory named: 'Phil's Shack'.

phil :)

Phil,

Thanks for the reply.

Let's walk the dummy through this:

BW AM SSB
N 9MHz 15KHz 2.4KHz
N 455KHz 6KHz 2.4KHz

9MHz -------- --------
455KHz -------- --------

W 9MHz -------- --------
W 455KHz -------- --------

Please fill in the blanks for me (if my my assumptions are wrong). This is my interpretation of the manual if I'm wrong , please correct me.

When I finish this email I'll go look at your file.

Thanks again.

John

Phil,

Since I sent the last email, I downloaded and read your "cookbook". I now understand the filter setup and, besides, there are some interesting tricks I plan to try out.

2517. New In Band On Carrier (IBOC) Broadcasting Test on WOR 710 AM.

Yahoo group: icomr75 (2000 — 2002)
Date: 2002-10-14 20:39:04 UTC
From: R H F
Topic: 2517 Message: 2517

Icom R75 Radio Owners:
? Do You Live in the WOR Broadcast Signal Area?
? Can You Hear the WOR Broadcast Signal?

WOR 710AM seems to be broadcasting a Second signal at 720AM.
This Signal sounds like Digital HASH.

Anyone in the WOR Broadcast Area have any reports on their 710 AM
Signal Quality?
Anyone in the WOR Broadcast Area have any reports on Adjacent Channel
Interference on 690, 700, 720 and 730 kHz.

HOW does the WOR Signal Sound on:
* AM ?
* AM-SYNC ?
* SSB ?

Does a Narrow Band Width Filter work on Reducing Adjacent Channel
Interference from IBOC?

There is a link asking for Listener FeedBack and Opinions:
http://www.wor710.com/Engineering/iboc/hdform.htm
Let WOR know what kind of Interference they are Generating on
Adjacent Channels from IBOC.

~ RHF

RHF,

I live in Suffolk County, Long Island and I checked this out (R75 &
Alpha Delta DX-Sloper)

I would love nothing more than to corroborate you theory, but it seems
to me that the signal has become very wide. As I tune from 710 through
720 it appears as though there is just a continuation of the same
signal, without a break or distinctive change in modulation.

I will keep listening and let you know if I hear anything different.

JS,

Thanks for the receiver and antenna information.

? Before IBOC, did WOR's Signal extend across two AM Broadcast
Channels from 710kHz to 720kHz?

? Is WOR's Signal Strength and Audio Quality at 710kHz and 720kHz the
same?

JS,

Sorry for the second follow-up questions.

? Have you used the AM-SYNC Mode at both 710kHz and 720kHz?
- What was the Audio Quality Like?

? Have you used the USB & LSB Modes at both 710kHz and 720kHz?
- What was the Audio Quality Like?

What about the Effectiveness of a Narrow Band Width Filter on both:
* 710kHz - What was the Audio Quality Like?
* 720kHz - What was the Audio Quality Like?

LR,

You are Correct.

These Reports should ONLY be for 'Day Time' Reception of WOR 710kHz.

Plus any 'Day Time' Interference of the Adjacent Channels:
690kHz; 700kHz; 720kHz; and 730kHz.

Using the Icom R75.

Hello,

Please see No.2099.
FL-102 is available for IC-R75, and easily installable.
But,There are some problems already mentioned at No.2099.

2526. PBT vs Selectable Synch?

Yahoo group: icomr75 (2000 — 2002)
Date: 2002-10-17 02:48:17 UTC
From: Dana Placzek
Topic: 2526 Message: 2526

Hello everyone,

I am thinking about buying the R75 and have joined your group as part of my research.

The one feature lacking, as far as I can tell, is a selectable synchronous sideband. Yet, it looks like the passband tuning will accomplish the same thing, as far as eliminating interference on adjacent frequencies? What about fading - does the AGC take care of this?

Every review I've read says that the Synchronous-AM mode doesn't really work well - is this true? Also, the manual (compliments of you all - thanks) says that the notch filter only works in SSB. Is this a big handicap? (I'm not quite sure what a notch filter does. This is another hesitation to buting this radio - it has a lot of features I'm not sure how to use. It may be overkill. But still, looks like one cool radio.)

Thanks,

Dana

I certainly concur with Peter's assessment. I look at the R75's features and ability to "tweak" as a real plus and you'll be using these capabilities to pull signals out of the noise as well as many more expensive comms receivers. Using Phil's Cookbook will help ensure you get a lot out of this rig and have some fun learning about SWL. Here's a link so you can take a look:

http://groups.yahoo.com/group/icomr75/files/Phil%27s%20Shack/CookBk11.pdf

Synchronous detection is supposed to take care of _selective_ fading:
when the carrier is attenuated more than the sidebands.

At any rate: the R75 is exceptionally stable.
To eliminate interference, you simply switch to SSB
mode, selecting between LSB and USB.
On most radios this works poorly, because the frequency
stability is not great, so that you have to fine-tune the frequency.
On the R75, most often you simply need to press the SSB button;
no retune is necessary. My R75 is off by only 10 Hz!
In other words, on such a stable radio, synch detection
is not very important.
You can use passband tuning to further trim a sideband, and
reduce interference, but I do not need to do this often.

In general, I have found the R75 to behave exceptionally well
in presence of fading (much better than the Palstar, for
instance).

The AGC in AM mode instead doesn't work well.
You can send the radio to Kiwa to fix for $35, or you
can fix it yourself with 1 capacitor and a bit of soldering.
I feel this is an important fix.

>
> Every review I've read says that the Synchronous-AM
> mode doesn't really work well - is this true?

The truth is that you don't need Synch AM.
I had it fixed, and now I find I never use it.
See above.

> Also,
> the manual (compliments of you all - thanks) says that

> does.

Notch filter works in all modes - it's an error in the manual.
The notch filter eliminates "whistles" (sounds with a single
frequency component).

From: Moxie3
Topic: 2526 Message: 2530

John,
I got the same thing. But when you receive that message, you need to go further a bit further. Click on "files" on the left, then click on Phil's latest cookbook dated last month. It's really great.
George

Hello Gordon,
Tried the link below and Yahoo tells me " The requested file or
directory is not found on the server." are you sure of this file. :-)

Gordon wrote: Using Phil's Cookbook will help ensure
you get a lot out of this rig and have some fun
learning about SWL. Here's a link so you can take a
look:

Gordon,

Thanks, I printed out a copy and will read thru it.

As far as comments about the link, I note that the
"hot link" chops off the 'f' at the end. This is a
quirk of the way the message wraps. Not sure of the
solution. I usually put in the HTML tags manually,
then check "Allow HTML tags".

Also, as far as the R75 pdf files go, I can't get at
them at home, but have no problem with them at work.
The only difference I know of is that at work I have
Acrobat v4, while at home I have v5. The error
message I get at home is "Unable to initialize
plug-in". Any ideas on how to fix this?

Dana

Do you Yahoo!?
Faith Hill - Exclusive Performances, Videos & More

2532. live Icom R75 stream - question about UT-102 speech synthesizer...

Yahoo group: icomr75 (2000 — 2002)
Date: 2002-10-17 15:35:32 UTC
From: the_muddy_mudskipper
Topic: 2532 Message: 2532

i wanted to share an annoying, but interesting live audio broadcast of my ICOM R75 scanning local CB Frequencies on the web...

http://www.shoutcast.com/directory/?s=san+antonio&numresult=25

if you tune my CB Scanner in San Antonio, you will most likely hear the following:

Channel 1 Local community calling and working (rare)
Channel 6 High power illegal activity (very common)
Channel 7 Local community calling and working (unlikely - mostly bleed from Channel 6)
Channel 17 North/South freeway traffic and trucks (nonexistent in my area)
Channel 19 East/West traffic and trucks ("hum" during daytime, good conversations at night)
Channel 30 and above SSB (some CQ activity on 36-39 near eve's)

my "CB Scanner" is an Icom R75 hooked up to a Mini Windom longwire.

the channels are programmed as follows:

26.965 Ch. 1 AM
26.975 Ch. 2 AM
26.985 Ch. 3 AM
27.005 Ch. 4 AM
27.015 Ch. 5 AM
27.025 Ch. 6 AM
27.035 Ch. 7 AM
27.055 Ch. 8 AM
27.065 Ch. 9 AM
27.075 Ch. 10 AM
27.085 Ch. 11 AM
27.105 Ch. 12 AM
27.115 Ch. 13 AM
27.125 Ch. 14 AM
27.135 Ch. 15 AM
27.155 Ch. 16 AM
27.165 Ch. 17 AM
27.175 Ch. 18 AM
27.185 Ch. 19 AM
27.205 Ch. 20 AM
27.215 Ch. 21 AM
27.225 Ch. 22 AM
27.255 Ch. 23 AM
27.235 Ch. 24 AM

27.245 Ch. 25 AM
27.265 Ch. 26 AM
27.275 Ch. 27 AM
27.285 Ch. 28 AM
27.295 Ch. 29 AM
27.305 Ch. 30 LSB
27.315 Ch. 31 LSB
27.325 Ch. 32 LSB
27.335 Ch. 33 LSB
27.345 Ch. 34 LSB
27.355 Ch. 35 LSB
27.365 Ch. 36 LSB
27.375 Ch. 37 LSB
27.385 Ch. 38 LSB
27.395 Ch. 39 LSB
27.405 Ch. 40 LSB

i wanted to know if using the UT-102 speech synthesizer will actually allow me to hear the frequency, etc as the squelch breaks...?

obviously, the goal is to have the channel, frequency, etc spoken through the shoutcast stream - and while i'm sure it will be annoying, it will pave the way for better streams (like true DX from tropical bands, overseas, etc...)

thanks for reading.

2535. Re: S-AM on R75

Yahoo group: icomr75 (2000 — 2002)
Date: 2002-10-17 19:33:13 UTC
From: Leigh Hanlon
Topic: 2535 Message: 2535

Dana asks << Every review I've read says that the Synchronous-AM mode doesn't really work well -- is this true? >>

Dana,

Afraid so. On my unmodified IC-R75, S-AM has never made much of a difference that I can tell.

When I sent a recent e-mail query to Icom's tech support regarding this issue, their explanation was that S-AM corrects signal fading by reinserting a synchronized portion of a wave back into a fading portion of a carrier. When I wrote back and said I never noticed any difference whether S-AM was on or off, and asked if I had to do anything other than press the S-AM button, I was told that nope, just press the button. But they were emphatic in reiterating that it must be a fading signal.

Aside from the S-AM issue, I'm satisfied with my R75. What annoys me is how Icom persists in advertising this "feature."

2536. Re: PBT vs Selectable Synch?

Yahoo group: icomr75 (2000 — 2002)
Date: 2002-10-17 23:07:16 UTC
From: just_rtfm
Topic: 2526 Message: 2536

hi Dana:

my detuning trick is a type of selectable synchronous sideband. here is how it works: lets say you want 600 kHz AM but the LSB part is full of noise. what you do is select the dual 2.4 kHz filters and tune upward 1.2 kHz (half the filter value)... to 601.2 kHz. what this does is only allow passage of the carrier (for synchronization) and the upper sideband (the clean one)... the LSB is chopped off. [to isolate the LSB you would subtract 1.2 kHz... tuning to 598.8 kHz]

from the factory the radio is EXCELLENT on SSB. remember, you can tune to any AM station using SSB (a process called ECSS tuning). if you really want this radio to shine on AM i suggest sending the unit to Kiwa for their Sync-AM and AM-AGC mods... the cost: $35. the notch does work on AM but sometimes slight detuning helps the unit get rid of the heterodyne completely.

as far as radios go they all have flaws. the R75 has two big flaws that (fortunately) take only $35 to fix. if they were not present the radio would probably sell for much more. after the Kiwa mod the radio is excellent on AM and SSB... and has many features over the competitors including: 1 Hz tuning steps, stable PLL, two pre-amps, 30-60 MHz coverage, twin PBT, good noise blanker, DSP noise reduction, DSP automatic notch filter, optional, 0.16 uV sensitivity, optional filter slots, decent tuning knob, bright and sharp display, etc. fixing or adding these features to the competitors' rigs would cost a fortune... this is what sold me. the rest of the equation is the antenna.

regards,
phil :)

ps i will look into what is causing trouble with my pdf files not being viewable. in the past people had to download the latest acrobat (they had old versions that did not work).

Well, Icom may not be completely wrong... I think we
R75 owners are blessed not to know what real "fading" is.
The R75 is especially resistant to the distortions caused
by fading, even in normal AM mode.
I recently purchased a Palstar R30, and while fidelity on
non-fading signals is better, the Palstar is _much_ more
prone to distort when fading occurs. It sounds like ...
crashing waves superimposed to the sound. The R75, even
in normal AM mode, is immune from this. So the S-AM may
work properly, but just not be all that useful on the R75.

What does need fixing in the R75 is the AM AGC, but that is
a simple modification.

Peter

2543. Smart Icom Control 32

Yahoo group: icomr75 (2000 — 2002)
Date: 2002-10-18 20:23:18 UTC
From: jmpickrelljr
Topic: 1307 Message: 2543

Group,

I'm giving Mark Fine's Smart Icom Control 32 (unregistered) a try and am having a problem, I can't get the S/W to fill the R75's memory.

I tried in both the MEM/VFO modes, cleared the memories I wanted to fill, reloaded windows (2K), all to no avail.

Can anyone tell me the secret?

Thanks,

John

Hello Peter,

Thanks, you cleared up a lot for me. The one thing
I'm not sure of is "how" the R75 compensates for
selective fading, although all the comments tell me
that it does very well.

What does AGC do, or what is it supposed to do?

Thanks,

Dana

AGC = Automatic Gain Control.
Gain = amplification.

Basically, it regulates the amplification so that the volume
stays constant enough for you to listen confortably.
In shortwave, the signal often varies quite abruptly in strength,
due to the variable nature of reflection from the ionosphere.

The problem is that on AM mode only, the AGC of the R75 is too
"fast", quickly increasing amplification when the signal
momentarily decreases in strength - the effect is too much volume
compensation, and it is unpleasant to hear.
Soldering a capacitor (or having it done for you from Kiwa)
solves the problem.

I also don't know how the R75 compensates for selective fading;
I guess it is part of the design details of the Motorola chip
used for AM detection.

Peter

there defintly digital hash extending +-8khz fromt the center
frequency of 710.. if a number if stations start transmitting on
adjacent frequencys (night time hops) they will step all over each
others digital signal. what a shame for the broadasters

I think the FCC will have to reallocate all of the AM BCB to
have stations 15 khz apart

2547. Re: S-AM on R75

Yahoo group: icomr75 (2000 — 2002)
Date: 2002-10-19 23:32:45 UTC
From: just_rtfm
Topic: 2535 Message: 2547

hi Peter:

i have modified my R75's sync-AM and AM-AGC. your comments reflect
the fact that sync-AM is more effective than 'regular' AM with regard
to fading. ECSS is even more effective but requires fine (1 Hz)
tuning steps for good resultant sound. btw, Motorola's C-QUAM AM
Stereo chip takes care of the sync... it has a +/- 3 kHz lock range.

> I recently purchased a Palstar R30, and while fidelity on
> non-fading signals is better,

how would you like your R75's fidelity to be like your Palstar's? i
am releasing just such a mod this weekend. i'm really enjoying it!

I've had trouble at times when I've set the radio to use baud 9600.
It usually works better when set to auto. Also make sure you havent
accedenty moved the radios address from 5A (i think thats the default)

If you have Excel 2000 then just download the spreadsheet macros
from the files section in this group. it will send your
frequencys right over to the radio

Thanks for the reply.

I went back and rechecked everything (including re-installation of the program) with the same (no) results. I run my serial channel @19.2k baud and the radio seems to like it.

I failed to mention that all other control options seem normal, just the fill command that fails.

In rechecking I did note that the radio was set to "MEMO" while the S/W was set to "VFO" and when I made the S/W configuration agree with the radio (I.E. S/W="MEMO") the fill command worked as advertised.

Classify this one as an "AW S--T".

John

Subject: [icomr75] Re: Smart Icom Control 32

I've had trouble at times when I've set the radio to use baud 9600.
It usually works better when set to auto. Also make sure you havent
accedenty moved the radios address from 5A (i think thats the default)

If you have Excel 2000 then just download the spreadsheet macros
from the files section in this group. it will send your
frequencys right over to the radio

2550. Re: S-AM on R75

Yahoo group: icomr75 (2000 — 2002)
Date: 2002-10-20 18:38:06 UTC
From: ptrlmpn
Topic: 2535 Message: 2550

Actually, in the R75, S-AM (as modified by Kiwa) seems to be just
as effective as normal AM wrt. fading.
I think the Motorola chip should be doing something helpful
even for normal AM, as the "normal AM" of the R75 is much better
wrt. fading than that of the, say, Palstar R30.

You are reseasing a mod to increase the fidelity of the R75?
I would be interested in it!

I am planning to build a synch-detector and fit it inside the
chassis of the Palstar, but that's another story...

The R75 is truly fantastic. BTW, speaking of EECS: I bought both the
9MHz 2.8KHz filter, and the 455KHz 3.3KHz filter.
The combination I use most often is 2.8 + 3.3 (resulting in 2.8):
I find the audio sounds much more natural than with the native
2.4 bandwidth. I sometimes use 15 + 3.3, but it doesn't always
sound better than the 2.8: more noise, and more difficult to tune.

2551. NEW: Fidelity Increase Modification

Yahoo group: icomr75 (2000 — 2002)
Date: 2002-10-20 21:00:38 UTC
From: just_rtfm
Topic: 2551 Message: 2551

hi everyone:

i have released an audio fidelity increase mod meant to enhance AM/SAM listening. the mod is located in the files section under "Phil's Shack". although it was created many months ago i only recently added the mod myself so i will report any downside as i do more testing. i am getting nice results especially while listening to music. my unit also has the Sync-AM and AM-AGC mods. as expected, i have noticed more high-pitched noise on some stations. the noise can be cleaned up by using the DSP or tone controls on external amplified speakers. i can now tell a difference between using the 15/6 kHz and 15/15 kHz filters. the mod involves making six solder connections to surface-mount resistors... parts cost is ~$1.

regards,
phil :)

Phil,
Thanks for all your tech info, etc. I downloaded your fidelity mod PDF file but it will not print. I get a "missing" error. (a linked graphic or file is missing.).

just_rtfm Wrote

hi Bill:

can you view the PDF on your screen when you open it?

Yes, it appears that the two graphics have the 72 dpi screen version imbedded (as normal). The hi-rez files are missing. The "HiFi" and the schematic. Hard to tell for sure as the Reader gives limited info.

If you upload those two files into your Yahoo folder it should be workable.

What's the best antenna I can place on the roof?
I live in a small rowhome in philly a block from a big hospital.
I want to use my r75 with my computer "amd1900 and a epox 8k3a+ mobo"
for computer control and cw and rtty receive decoder programs.
I am in the front upstairs room with the radio and computer next to
one another,"about 4 feet apart".
I have right now a coax going to the middle room where I made a temp
antenna wire that goes down to the ally wall from the window.
also I ran a second wire down to the water faucet in the yard for a
ground.
My receive is great untill I turn on the computer, then the noise
starts.
I dont't have a lot of room for a long wire as I must stay only on
my roof which is about 16ft wide east to west and about 34ft north
to south.
What should I put up on the roof?
Simple wire antenna, "will the computer noise still be there?".
Any awnsers ????
A active roof antenna, "will it increase noise from the computer"?
Thank you !!!!!!!!!!!!!!!!!!!
Help!!

I have a Wellbrook ALA 330 that gives me very good reception with very
little noise from my computers. The ALA 1530 is also good, if you
are not very close to powerful AM transmitters (I am).
These are loop antennas, that tend to pick up less local noise,
since they are sensitive to the magnetic component of the waves,
while most local noise has a stronger electrical component.

Anyway, I highly recommend them; go to the Wellbrook site for more
information.

In a nutshell...no, this may not be a problem. I was concerned, At the time, I had just installed CR282 and noticed the heat being generated by the circuit. A call to Icom tech support,(10-21) confirmed the circuit will run warm and their is no history of related failure. In fact the guy said the R75 has an excellent reliability record. For the engineering types I was curious as to the actual current flowing thru r1401-for comparison. The resistor is designed for heat and mine shows no signs of degradation. The 7805 regulator (ic1401) is rated at 1000 ma. (abeit:proper heat sink) My r75 pulls approx 700+ ma in series with r1401. IMHO a little to much for not having a chunk of aluminum as a heat sink. Looking over the schematic-this 5 volts is used everywhere thru-out the r75, so if there was a defect it would be readily noticed in operation. Anyway I may mod my r75 and move the regulator to a heatsink mounted out on the backside of the unit for better heat dissipation. I performed a simuliar mod to my Kenwood r5000 (years ago) and it made a big difference!

Then it is normal this heating type.

I also notice that in the regulator of 5 volts, of everything ways believe
that the disipador that has is enough, undoubtedly it is better not to cover
the right side of the rx.
Enrique

Ps.: In the case of the serial connector temperature, the trouble is other,
IMHO hmmm....

Bill,

You have a 100 Foot Perimeter around you Roof.
1. A 100 Foot Horizontal Loop would 'offer' Low Noise Antenna.
Or, a 100 Foot Four Sided Bent Random Wire Antenna.
2. Coax FeedLine would 'reduce' noise pick-up into an around the R75
and your Computer.
3. A Matching Transformer would effective 'couple' the Antenna to the
Coax.

* * * The 'Low Noise' SWL Antenna * * *

From the Association of North American Radio Clubs (ANARC) website
and the Rec.Radio.ShortWave (NG) Web Page Text Written by John Doty
* http://www.anarc.org/naswa/badx/antennas/low-noise_antenna.html

=Quote= It doesn't take very much wire to pick up an adequate signal
for anything but the crudest shortwave receiver. The Difference
between a mediocre antenna system and a great antenna system isn't the
antenna itself: it's the way you feed signals from the antenna to the
receiver. The Real Trick with a shortwave receiving antenna system
is to keep your receiver from picking up noise from all the electrical
and electronic gadgets you and your neighbors have. =Un-Quote=

Diagrams of Random Wire Antenna using a Balun and Coax FeedLine
* http://www.geocities.com/n2uhc/wire.html
* http://www.kc7nod.20m.com/improved_rw.htm

RHF = Here is my Double Nickel (Ten Cents Worth) on this
Very Simple and Basic Low Noise SWL Antenna:
1. 50-200 Feet of 14-16 AWG Insulated 19 Strand Copper Wire
2. Height of Support Points 15-30 Feet.
3. Bottom Feed Point for both Ground and Coax.
4. Matching Transformer (UnUn)
5. Bury the Coax if possible.

A Great "Balun" (Really a "Un Un" Matching Transformer) for this and
many other antennas. Is the ICE 180 that is not only a Matching
Transformer but a Lightening Surpressor.
http://www.hard-core-dx.com/nordicdx/antenna/feed/ice180.html
This Hard-Core-Dx.Com Web Page Text Written by John Doty
=Quote= A Matching Transformer at the Base of the Antenna can smooth
out the fluctuations in antenna system efficiency with frequency,
yielding an Antenna System that Works well enough for good reception
from LongWave to the top of the ShortWave Range. =Un-Quote=

Here is a "Do-It-Yourself" Matching Transformer

If your roof is high and you are primarily interested in a couple of bands, you might consider a simple horizontal dipole. "High" means more than 1/2 wavelength so you get a low angle of attack for DX. The length of the dipole is a little less than 1/2 wavelength - exact formulas are widely known but I don't remember off-hand, but for example for the 40m band you need about 20m of space and each element is 10m long. You get a small amount of gain by orienting perpendicular to the signal of interest. You can couple more than one pair of elements to the same coax in a crossed fashion to achieve multi-band reception, or you can buy or make a G5RV which is available on eBay for about $20 and does the same thing. Dipoles are supposed to be low noise, and of course the coax feed greatly helps in this regard. Incidentally, some will tell you that you need a balun to couple the balanced dipole to the unbalanced coax; others will tell you that one element is simply soldered directly to the shield and the other to the center conductor, and that the long length of coax, through electromagnetic magic that literally nobody understands, acts as a balun.

Many of us notice that there is little difference between the AM and S-AM (synchronous AM) modes of the Icom R75, and infer that the synchronous detector is defective. I would like to advance here the opposite explanation: there is no difference because the AM detector is already essentially a synchronous detector.

This implies that the (much maligned) AM mode of the R75 is in fact outstanding, a fact supported by my practical observations.

My explanation is supported by two facts.

First, the R75 uses as AM detector the Motorola chip MC13022A; the chip is essentially the same as the MC13122, which just adds a noise blanker. Detailed specifications are available for the MC13122. If you look at the R75 circuit diagram, and at the MC13122 specs, you will notice that the AM mode of the R75 relies on a blend of the E output (described by Motorola as semi-synchronous detection) and I and L+R (described as synchronous). In particular, it is not a simple envelope detector.

Second, it is so difficult to find signals affected by differential fading (the different fading of carrier and sidebands) with the R75 in AM mode that I used to think that selective fading is a rare phenomenon. Not so. I recently purchased a Palstar R30, which has a traditional envelope detector, and I was able to make many side-to-side recordings of the R75 and Palstar for signals affected by fading. The R75 was used in AM mode, after the Kiwa AGC modification (adding a capacitor to fix the AGC constant in AM mode). The Palstar suffers badly: I now understand for the first time what is the "crashing" noise when the carrier fades relative to the sidebands. The R75 is essentially immune from any negative effects. I have many 30-second snippets (in .wav format) available. The total is 600MB, but if somebody tells me what is an acceptable sample and stream rate for .mp3, I could try to convert them and make them available on the web.

I am truly impressed by how flawlessly the R75 performs in AM mode for weak signals affected by fading (again, after the AGC constant fix). If anyone has another radio, and would be willing to make side-by-side comparisons between the R75 and that radio in AM and S-AM mode for signals affected by fading, I would be very interested in the resulting computer recordings.

All the best,

Peter

There are many pre-built units that offer good performance.
Mini-Circuits is one that I am looking into. Although they
only seem to offer the BNC or N type connectors.

http://www.minicircuits.com/dg03-120.pdf

http://www.minicircuits.com/cgi-bin/spec?cat=splitter&model=ZFSC-2-6&pix=k18.gif&bv=4

Of course there is also "Stridesberg Engineering" with their
choice of active or passive splitter products although a little
bit more pricey. But they are certainly made specifically for
that purpose.

I have to admit, I am coming to almost the same conclusion. For me, it took the addition of another radio side by side to see the difference.

I am in San Francisco Bay area. I had both my Kiwa-modified R75 and my new DX398 running "side by side" last night on several stations with "short hops" - such as Sackville, Bonaire, Guiana and Greenville. In every case, some selective fading occurred a bit. In every case, the accompanying distortion was severe on the DX398, with unintelligible language during the fades. On the R75, however, while the fade itself was noticeable as a signal reduction, the intelligibility *NEVER* was reduced much at all, either on AM or S-AM. S-AM showed a *modest* improvement over straight AM, but both allowed the language to remain perfectly understandable. I was almost peeved by the idea that there was no appreciable difference between the two modes - except that when tuning is performed in "AM" there is no squealing. I have come to my senses, however :-)

> This implies that the (much maligned) AM mode of the R75 is in fact
> outstanding, a fact supported by my practical observations.

To be honest, I did notice some distortion on AM prior to the Kiwa fix. That distortion is now reduced on AM and eliminated on S-AM. Otherwise, I am in agreement. It is actually only the AGC that needs the "fix."

I am unable to place recordings on the internet right now, but I can
assure you, what I heard last night *exactly* matches your experience.
Hideous distortion on the DX-398, i.e., that *crash* you mention and
garbled speech, alongside nearly pure clarity on the R75.

I'd like to suggest that this message be placed on the newsgroups as well.
This message is one that needs to get out. Thanks, Peter, for starting
this line of thought.

Hi Eddie,
Yes, they all seem to be BNC boxes. I need (of course) SO-239. Years ago we used to just put three windings on a torriod, but I no longer have any recipes. Hi-Z splitters we built from three resistors in a delta configuration.

Universal Radio sells one for $90. <wince> See:

2573. AGC mod vs. RF gain control

Yahoo group: icomr75 (2000 — 2002)
Date: 2002-10-24 15:45:35 UTC
From: Dave Ulrick
Topic: 2573 Message: 2573

Hi,

I own an unmodded R75. When listening in AM mode, I can hear the AGC-related pumping/distortion on all sorts of signals if I have the RF gain control set to 12 o'clock, but if I turn the RF gain control to the left until the S-meter's reading begins to rise, this seems to stabilize the audio and eliminates most fading distortion. With most strong stations, the adjustment works out to be two marks to the left, so I find that stabilizing the audio in this manner is very easy to do, and the resulting audio is quite pleasant to listen to. This trick seems to work both in slow and fast AGC modes. (Of course, the trick is _essential_ if I turn AGC off. :-))

My question is this: is there any improvement in the R75's AM audio gained by the AGC mod beyond what I hear when I back off the RF gain, or does a modded R75 sound pretty much the same as what I'm already hearing? I'm happy with the audio quality I get when I back off the RF gain, but if the AGC mod will give me a further improvement, I'll consider having it done.

Thanks,
Dave

In a word, yes. The AGC mod is the best thing Kiwa does, and if you can do it, well worth the effort. It largely removes the need to back off the RF gain, and *this is really useful for weaker stations.* For strong program listening, when the AGC doesn't exactly match the fading, a little backing off can still help, but not critical.

The added filter is nice too. The audio mod, I think, is probably not very critical.

2575. Tuning in on Lowfers

Yahoo group: icomr75 (2000 — 2002)
Date: 2002-10-24 16:39:00 UTC
From: Ashlock,William
Topic: 2575 Message: 2575

In case some of you guys might be interested in copying 1W beacon signals on the 160-190KHz so called 'Lowfer band', take a look at Mitch Powell's site: http://technology.fanshawec.on.ca/tele354/ . Once on the site click on the section showing a series of screen captures of a group of six beacon signals from all over the US operating at the popular 185.300 to 185.305 portion of the band - all copied at the same time! Yes, that's only 5Hz of bandwidth. It's slow CW typically 30 sec dots, 90sec dashes, so you have to see them rather than listen.

To receive these signals with your R-75 all that is needed is a free downloaded program called ARGO, a sound card in your computer, and a descent low frequency antenna. Could be a loop or a simpler E-probe antenna, but forget about that long-wire unless you are located far from any power lines and neighborhood computers. Since local noise sources tend to be a real problem at these frequencies a 1 to 1 isolator transformer (typically a #43 ferrite core or bead having a 20T to 20T ratio) is usually required next to the R75 to remove the noise riding on the coax feed line to the antenna.

If there are any questions (on Lowfer transmitting too), let me know.

I've tried all these tricks (except the mods) and I think ECSS works better than any of them, especially with the 3.3kHz filter, and without any adjustment of AGC. All I do is push the SSB button (maybe twice to check both sidebands) and tweak the PBT a little to improve the tone and I'm done - don't even have to adjust the frequency.

I think I might be catching on. :-)

If I understand correctly, what the AGC mod would buy me is reduced audio distortion without any need to reduce RF gain. I can see how that would be a Good Thing especially for weak signals. I think I understand what you're saying about turning off AGC. I find that turning off AGC tends to give me the very best audio, but with that method I've got to be extra-careful about how I set the RF gain.

By the way, I notice that Kiwa has partially suspended operations until they complete a move to another state. When I tried to send an email to them, it bounced with a message that their mailbox was over quota. I suppose I'll have to patiently wait for them to finish their move before I pursue getting the mods.

I may be wrong, but I believe that reducing the RF gain
does not completely disable AGC: what it does is limiting
its range. If you decrease the RF gain, you essentially
attenuate (though a variable resistor).
Hence, there is less range between the maximum amplification
that can still be provided, and the amplification that the AGC
wishes to provide.

The fading on max RF gain happens when AGC tries to increase
gain a lot during a fade. If there is no more space for
increase, then this problem becomes less serious.
At any rate, the Kiwa AGC mod will still be a substantial improvement.
Now that Kiwa is closed, you can also try to do it yourself:
it only involves soldering a capacitor.

Best,

Peter

2580. Re: [icomr75] Re: AGC mod vs. RF gain control

Yahoo group: icomr75 (2000 — 2002)
Date: 2002-10-25 04:51:23 UTC
From: Gert Nilsson
Topic: 2573 Message: 2580

The KIWA(?) AGC mod of the AGC make the internal AGC of the AM demodulator chip a little slower, thus the AGC derived outside this circuit to decide the total AGC.

AGC is not a simple attenuation through a resistor. The AGC detector/amplifier produce an AGC voltage provided to the AGC line on several amplification stages in the receiver. Total AGC range may be around 100 dB. Using the RF gain produces a DC signal applied to the AGC line. When this DC signal is stronger than the derived AGC voltage, the DC signal decides amplification/gain. This signal is not fluctuating at all, thus the stable reception. You can find a postion where the applied DC signal is just about the same as the AGC level. This is often the best level which makes listening very good. The NB depends on total amplification. If you reduce gain to much, the noise gate won't operate normally. If you on the other hand turn AGC off and use the receiver with more than usual RF Gain the noise gate may operate on weaker noise levels!
I may be wrong, but I believe that reducing the RF gain
does not completely disable AGC: what it does is limiting
its range. If you decrease the RF gain, you essentially
attenuate (though a variable resistor).

2581. Hello and info request

Yahoo group: icomr75 (2000 — 2002)
Date: 2002-10-25 07:07:51 UTC
From: wywh273
Topic: 2581 Message: 2581

Dear friends,

I just bought a new IC-R75 with DSP to substitute my Yaesu FRG 100.

I have subscribed to your list and downloaded messages generated since July 2002 to avoid questions already answered.

It is extremely instructive to read all of these tips and such "passionate" (to understate) discussion on certain topics.

At the moment I am in the learning phase and playing games with filters
combination.

1 point that might be of interest to new-comers.

I run a RadioRaft software and RadioCom 4.0.

In the beginning I linked the cables as I had done with the FRG 100.

I.e. RadioRaft decoder from the Rec Exit to the RS serial port (COM 2) of PC and
the sound cable for RadioCom from the Ext. Speaker plug straight to the
Sounblaster input. Control was through CAT device on COM1.

In the beginning it was just a mess. The decoders were not working, and
all I could hear was just an awful audio through the PC Monitor Louds.

I went to the R75 set menu and discovered the REC REM was on. Switching
it to off fixed all the problems.

My next step is to build up a new controller for the RadioCom.

BTW, I read about R75 Smart Control software. Could you give me some hint about it and the kind of interface I need?

I downloaded the r75.zip file and the xls manager, but I could not find
help on the interface.

Last but not least could you tell what is the best mix of factory filters to enjoy the Twin PBT at its best in AM?

My current configuration is as follows:

Standard: 9Mhz 15 455K 6

Narrow: 9Mhz 2.4 455K 2.4

Wide: 9Mhz 15 455K 15

With this configurazion the Standard AM seems not to gain a lot from Twin PBT, while SSB improves a lot. Suggestions?

Thanks a lot for your attention / help.

I-2140 TO Michelangelo

2582. Re: AGC mod vs. RF gain control

Topic: 2573 Message: 2582

I know that AGC is more than attenuation through a resistor!
I was simply saying that I believe that RF gain control is simply attenuation through a resistor. When the overall RF gain decreases (due to the resistor), the AGC has less room for maneuvre, since the difference between the max RF gain that can be delivered, and the RF gain required by the AGC and subsequent detection, becomes smaller.
I hope this is a somewhat better explanation... do you agree with it?

Peter

--- In icomr75@y..., "Gert Nilsson" <gert.nilsson@m...> wrote:
> The KIWA(?) AGC mod of the AGC make the internal AGC of the AM demodulator chip a little slower, thus the AGC derived outside this circuit to decide the total AGC.
>
> AGC is not a simple attenuation through a resistor. The AGC detector/amplifier produce an AGC voltage provided to the AGC line on several amplification stages in the receiver. Total AGC range may be around 100 dB. Using the RF gain produces a DC signal applied to the AGC line. When this DC signal is stronger than the derived AGC voltage, the DC signal decides amplification/gain. This signal is not fluctuating at all, thus the stable reception. You can find a postion where the applied DC signal is just about the same as the AGC level. This is often the best level which makes listening very good. The NB depends on total amplification. If you reduce gain to much, the noise gate won't operate normally. If you on the other hand turn AGC off and use the receiver with more than usual RF Gain the noise gate may operate on weaker noise levels!

I don't have any electronics experience, but I know some folks who do.
Is the AGC mod what's shown as 'C2' at:

http://groups.yahoo.com/group/icomr75/files/R75%20mods/S-AM%20mod%20v2.1.pdf

pin 4 on IC2001 (AGC) to ground? (OK, I know a few electronics
symbols, but don't let that fool you. :-)) Is IC2001 clearly marked
when you open the case, or do you need to use the block diagram or
schematic to find it?

hi Dave:

yes, attach a 220 uF electrolytic capacitor (in the proper orientation!) between IC pin 4 and ground. see Dr. Rado's PDF version 1.1 (aka the earlier one) for pictures and more details!

http://groups.yahoo.com/group/icomr75/files/R75%20mods/R75_AM_and_SAM_mod_VER11.pdf

FWIW i am planning on releasing a PDF teaching soldering to surface-mount this weekend.

regards,
phil :)

I'd love to hear some recordings! Although my 75 has the 2.1 mods, I am still not happy with the sound. Years ago I would not have hesitated to make any mod. Now that I am a senior citizen and the components have gotten even smaller, I hesitate. The more info the better!

You might add that it would be adviseable to perform the Phildelity mod BEFORE performing the Synch/AGC mod. Just a thought I had. Although, had I done a cleaner method when I did the synch mod, there might have been more room. Ahh, hindsight. Ain't it grand?

Dear Rado,

It is nice to read about your work to improve the receiver R-75.
I am planning to buy a new receiver and R75 is a hot object. I have tried to turn the main dial knob and I noticed that this knob is not spinning as easy (I am perfectionist also) as I would like it to be. Can you please tell me if this is possible to adjust on R75? Is it possible in any aspect to adjust the main dial mechanism or is it just there with the knob pushed on the dial shaft? I am of the opinion that more expensive receivers have the possibility to make some dial/knob adjustments...

How do you like the receiver when listening on 0,5 - 1,5 MHz and all the strong stations in this band during evenings?

Best regards

Hi Lars,

There is a little tension adjuster at the bottom of the knob. It looks a bit like a slide switch. I have never tried it, however.

Hallo Lars!

There is a simple friction control for the main dial. I always use it with minimum friction.

It copes quite good with strong signals in the AM band. However there are other receivers on the market with better strong signal handling. My old R71 is perhaps a little better in this respect.

Yes. It works in all am modes and all filters. It is really an AGC mod,
and the S-AM really already works well.

Best wishes,
Bruce Jensen

2605. VFO/MEM transfer

Yahoo group: icomr75 (2000 — 2002)
Date: 2002-10-29 04:30:14 UTC
From: Marv Loopstra
Topic: 2605 Message: 2605

Hi all,
Haven't played much w/ the transfer feature from VFO to MEM and vise
versa for the past year or so. Did so tonight and am hoping I am doing something wrong:
I can transfer from MEM to VFO as the book says but when I do the same
thing from VFO to a blank memory, absolutely zilch happens. My blank
memory remains blank. It beep once, not twice though. Blank Skip is
"OFF".
I am hoping that it is operator error....
Can anyone put me at ease and tell me my radio is ok, it's me that's
broken?

When in the VFO mode, if you hold the MW button for 2 seconds it will write the contents of the VFO to whatever memory location is displayed in the lower right of the display.

you can do this with filters... see my cookbook in the files section.
basically you use the narrow dual 2.4 kHz filters and detune by plus
(USB) or minus (LSB) 1.2 kHz (half the filter width).

phil :)

OOPS! Left something out. When you go back to MEM mode, if you see nothing displayed, press the SEL button to display the frequency, otherwise you will see nothing because you hadn't entered a name for the frequency. Not sure that makes sense to you. It does to me. I have a tendency to NOT make myself clear at times :~)

Hi Phil, Jim and all,
Oh, believe me Phil, your book is the first place I went to!
Looks as though I have a problem then.
1) In VFO mode I tune a freq.
2) I select a memory to transfer it to, as illustrated by "BLANK"
above the number.
3) I press V/M for 2-3 seconds.
4) I press V/M to go back to MEM mode and find that it is still blank.
5) I press SEL and it remains blank.
My baby's not well.... I am heart broken.
Marv :-(

Well - it is not sideband-selectable, so you cannot lock the USB or LSB for synch AM. That is not the design.

Not a bad substitute, however, is using the S-AM in either 2.4 or (if you have gotten one) the 3.8/4 kHz filter, and turning the PBT one way or the other to minimize the offending sideband interference. Works quite well!

I have experienced the same problem. It seems that I have to do the operation several times before I get a freq. into a memory location. I thought it was just my ignorance.

2618. Introduction

Yahoo group: icomr75 (2000 — 2002)
Date: 2002-10-30 03:36:20 UTC
From: bmartin000
Topic: 2253 Message: 2618

Good day/evening everyone. I just found this group and glad I have. I am nowhere near as technical as many in this group, though I hope to gain some insight from those that are. I won't ask alot in this post. I just thought I would introduce myself and say hello. I've been an R75 owner for about 2 years now and have nothing too bad to say about the radio. It is by far better than anything I have owned previously and have pulled some very nice DX out of it with nothing more than a long wire. The SAM has gotten alot of bad press and I must agree, although I never owned or heard a radio that possessed SAM so I'm not sure what it should sound like. I do know that by using the PBT and SSB that I was able to pull out very weak stations. Nevertheless I will not go on about such things. And now with the help of Phil's cookbook, those utes are coming in wonderful, mostly do to the good software available. How things advance in a couple years. I do have some filter and mod questions but that can wait until I have read all 2000 previous posts :). Although alot of posts seem to be between a reciever that's price is almost twice that of the R75???? How you can compare such things,to me is like comparing a Sable to a BMW. And the Sable being better. :)
Anyway. Glad to be a part of such a fine lookin group.

2619. Evaluation of Mizuho AT-2000 Antenna Coupler/Tuner

Yahoo group: icomr75 (2000 — 2002)
Date: 2002-10-31 21:45:25 UTC
From: Moxie3
Topic: 2619 Message: 2619

Payman,
By far, you are asking the wrong person to do an evaluation of the Mizuho but I'll do my best. You got to also realize that I haven't fully learned the Icom's controls, let alone other related issues. But since you asked, I thought I would get this off and maybe later do an updated evaluation on performance when I have more experience with it.

Reason for Buying a Tuner: To hopefully better tune stations; in other words, to hear stations more clearly.

Why a Mizuho vs. Other Brands: Because of various recommendations, including some from members of this site including David Ross and Paulo, as well as evaluations from other sources on Mizuho products which were all highly satisfactory. I found that many hams rate Mizuho products highly and some collect Mizuho products as well. There is an internet group, with seemingly cult status, exclusively for Mizuho users. Because of recommendations, Mizuho's reputation, and the fact that the unit is passive (no power required), I decided on Mizuho and this particular model, the AT-2000.

Construction: The tuner appears to be constructed very well. It is has an all metal case and is made in Japan. Medium gray color on top and sides with a dark gray front. Looks great on top of my R75.

Controls: Consist of 2 tuning knobs which are used in conjunction with each other to achieve peak sensitivity, a 4 position "Q" selector knob (this allows selecting the best matching point) , an 8 band selector knob, and a bypass slide switch which allows you to bypass the tuner. You can see a diagram and picture of the tuner at www.jjdcom.com/Global-AT2000.htm Another picture can be seen at www.thiecom.de/at2000.htm - this is where I purchased my tuner. The rear consists of connectors for coax and wire antennas but I think that only one antenna can be used at one time as there isn't an antenna selector switch.

Cost: Paid $127 (the price varies with the exchange rate but I had added about $1.50 to compensate for possible changes in favor of the Euro) delivered from Germany from THIECOM Import-Export Communications in Bremen, Germany for a new unit. There are other companies such as www.wsplc.com/acatalog/Online_Catalogue_Receiver_ATUs_28.html in the UK which sell the identical unit under the Global brand name, the Global AT-2000, for about $15 to $20 more but easier to purchase as they accept major credit cards. Decided to go with the German company as they were the only company I could locate selling the tuner under the Mizuho name. Although the company requested a bank draft in Euros, the bank wanted $40 for the draft. At my request, the company accepted a certified bank check in dollars which didn't cost anything. I preferred the Mizuho name rather than the Global brand name because Mizuho is known internationally and may be easier to sell if need be. As a matter of information, I am told, that Mizuho does not make this tuner any longer but this information was not confirmed.

Performance: I guess this is what you're really looking for. The problem is that since I haven't had much experience with the tuner, nor any tuner for that matter, I really don't

know what I should be expecting. Not even sure whether I'm tuning it properly. Anyway, I've used the tuner now for about 20 minutes and had decided a few minutes ago that I can't notice any difference whatsoever. I had tried comparing several stations, with and without tuner, and could not determine any difference. However, just received a somewhat weak station on 12175.00 with a lot of background noise, etc. Switched the bypass switch to tuner, set the band and "Q" setting and tuned the 2 knobs; it works. The voice was barely audible and had a lot of background noise - the tuner brought the station in so that you could understand the voice and it reduced background noise. But this was the only time I could determine a difference so I really don't know what to tell you. Since I use my radio only casually and very occasionally, I would definitely not recommend a tuner for someone like myself as the benefits are minimal. Would I spend $127 for the tuner knowing what I know now? No!
George

From: just_rtfm
Topic: 2622 Message: 2622

hi everyone:

i have uploaded (link below) a wav recorded after doing the fidelity increase mod [note: Sync-AM and AM-AGC mods were also done]... notice the highs in the song. settings were S-AM and dual 15-kHz filters... the first 10 seconds were with NR on (fidelity ~4200 Hz), the last 10 seconds without (fidelity ~6200 Hz).

if your primary R75 usage is world-band or music listening you will enjoy this mod. if your primary usage is ham or utilities then you may want to use a switch. either usage has a choice between the 47k-ohm and 100k-ohm resistors... to obtain filter bandwidths of 5500 Hz and 4200 Hz respectively.

http://members.truepath.com/justrtfm/philmod.wav

regards,
phil :)

2626. shall I buy an R-75?

Yahoo group: icomr75 (2000 — 2002)
Date: 2002-11-01 18:27:29 UTC
From: dukeofbecker
Topic: 2626 Message: 2626

I was a casual SWL for many years with a SONY 2010...It fell off a high table and broke...Tried to open it up to fix it myself, and that was the end of my SWL habit for quite a while.

I'm looking to get back into SWL, and I was considering a Grundig 800. An online review of the 800 from Radio Netherlands states that the R-75 may be an "interesting alternative" to the Grundig 800.

It seems that reviewers of the R-75 always have overall praise of this radio, but there is constant criticism of the SAM. Despite this, I'm seriously considering buying the R-75. I had synchronous selectable sideband on the SONY 2010 for years, and really never felt a need to use the "selectable" option. I imagine I would feel the same about the ECSS technique I've read about here.

My feeling is that although the Grundig 800 would be a fine radio for me, I will always yearn for something a bit more hardcore. The Drake R8B would be "overkill" for me. The sensitivity of the R-75, along with features like noise blanker, twin PBT, AGC, and the $600 street price seem to be drawing me in.

The question to all of you is...should I buy an R-75?
...or would the extra features, performance,and expense be wasted on someone who is, at present, almost exclusively a casual program listener?

What do you think?

2627. BCL filters?

Yahoo group: icomr75 (2000 — 2002)
Date: 2002-11-01 18:31:00 UTC
From: k0adl
Topic: 2627 Message: 2627

If I have an R75 and I am primarily interested in broadcast band listening, medium wave listening and hi-fidelity SSB, is there ANY reason that I should consider filters other than what ships from the factory? Again, I will emphasize that I am primarily interested in the best sound possible from the large broadcasters rather than spending hours trying to pick out some utility station in Antarctica. I currently have installed the S-AM mod, agc mod, DSP unit and voice synthesis unit. I pipe the audio out to a 7 band Rotel equalizer, Kenwood stereo amplifier and two large three-way Kenwood stereo speakers.

Thanks in advance for your advice!
Alan,
KØADL

If you have the money, go for it. You won't be dissappointed. Maybe having a top quality radio will stimulate a keener interest.

Don't worry about the S-AM. That function (with selectable sideband) is easily replaced by using USB or LSB on AM signals because the R-75 has excellent frequency stability and the PBT lets you adjust the pass band for good fidelity. The details can be found in the various files stored on this group.

Keep in mind also that to get good use out of this (or any high-end) radio you will want a good (but not necessarily expensive) antenna - preferably outside.

Hi - The R75 is a near-great radio by any standard. The S-AM problem is really overblown, and in fact, a brief discussion a few days ago explored the idea that the S-AM actually works quite well, especially with the Kiwa AGC mod. If you put an R75 side by side with a non-S-AM receiver, the difference becomes glaringly apparent - the S-AM on the R75 works very well. It just doesn't have the sideband selectable option, but that can be at least partially resolved by judicious use of the PBT. If you add this AGC mod (really a good idea) plus a 3.5-4 kHz filter to the radio, I seriously doubt your SWL DXing experience will be limited by anything except your antenna and local RF noise conditions. The sound is a little cramped by the small speaker IMO, but a decent external speaker or headphones solves this perception problem outright.

The DSP is really useful if you can get it. Good used R75s with the DSP can usually be had for $500 or less on places like EBay. The repair rate on these seems to be pretty low; I don't think there is a particular problem with getting one used if you trust the seller. Mine has been running beautifully for well over two years now.

Having said all of this, if you intend to stay purely a casual program listener, you'd probably get perfectly acceptable performance out of something less intricate and lower-priced. The S-AM is really nice, so the Grundig might be the way to go...and no mods really required to extract everything it is capable of delivering.

Good luck to you,
Bruce Jensen

2631. RE: [icomr75] shall I buy an R-75?

Yahoo group: icomr75 (2000 — 2002)
Date: 2002-11-01 21:42:58 UTC
From: Gordon Hagewood
Topic: 2626 Message: 2631

For casual listening and a good synch detector you can't go wrong with the Sat 800.

For a little more "hardcore" I'd go with the R-75. I own both. For listening to reasonably strong signals from BBC, Radio Canada(s), Australia, etc. (and much better sound), the Sat 800 is my choice. When I want to dig out AFRTS on SSB and really clean up the signal, you can't beat the wide range of controls on the R-75. Also, the ECSS mode with the R-75 is excellent due to receiver's excellent stability.

You might inquire with Universal Radio or Drake if they have any refurb Sat 800s. You could also check eBay. You can try it for a while and keep it if it suits your needs. If not, sell it on eBay for most of what you paid. If you can get the R-75 with the free DSP option for under $600 and money is not the issue, I would go with that. Using Phil's cookbook in the R-75 group files section will help you get the most out of it. The R-75 is the receiver I have the most fun with.

Gordon

Snippet below:

My feeling is that although the Grundig 800 would be a fine radio for me, I will always yearn for something a bit more hardcore. The Drake R8B would be "overkill" for me. The sensitivity of the R-75, along with features like noise blanker, twin PBT, AGC, and the $600 street price seem to be drawing me in.

The question to all of you is...should I buy an R-75?
...or would the extra features, performance,and expense be wasted on someone who is, at present, almost exclusively a casual program listener?

What do you think?

The R75's unmodfied S-AM is akin to buying
a box of condoms advertised as being lubricated,
finding them to be dry, wondering about the
manufacturer's definition of moisture, and then
being told on a newsgroup by satisfied customers
that it doesn't matter since you ought to have
a separate bottle of lube, anyway.

Leigh Hanlon
Chicago, USA
(Still happy with my unmodified R75 despite its sucky S-AM)

Here's what the 2003 edition of "Passport to World Band Radio" has to say about the R75 and S-AM:

--> "The Icom R75's sync is virtually useless."

--> "Synchronous detector virtually nonfunctional."

--> "The R75 would have significantly more appeal if it had properly performing synchronous selectable sideband."

--> "The factory should have made this simple change in production years ago, but for whatever reason, Icom insists there is no problem."

Icom also doesn't seem to mind the criticism. They bought a full-page ad on Page 5, on which they tout this "innovative feature."

I apologize if thats what you thought. There was definately nothing wrong with the cookbook whatsoever. In fact I meant it to come across as an extremely helpful document. I had a few brown pops at the time of typing that so what I said may not have been very clear. :). You put together some very helpful tips. There is no need to redo the pdf as I am technical on the computer end, just not so much the radio end of things. I'm using the latest adobe, so no worries there. In fact your tips allowed me to successfully capture some SSTV which I have always been curious about. Like I said, I wish I had discovered this group two years ago when i bought the radio because life may have been much easier. But then again, the challenge is half the fun. Thanks again.

Bob

2640. Dead horses and S-AM

Yahoo group: icomr75 (2000 — 2002)
Date: 2002-11-02 03:37:45 UTC
From: saucerchaser
Topic: 2640 Message: 2640

At the risk of beating a dead horse, a few minutes ago I tuned both my SW77
and R75 to Radio Havana at 9.820 MHz. I used simple indoor antennas on
each radio: the whip on the SW77; a modified VHF TV rabbit ears for the R75.
(When I feel ambitious, I string a wire out to a nearby tree next to the
apartment building. But the whip and rabbit ears usually work great.)

Radio Havana's signal had moderate interference on both radios, and
occasional minor fading. Without engaging synch on either receiver, my
unmodified R75 definitely delivered a cleaner, more listenable signal, both on
headphones and its internal speaker. I don't know whether there was less
interference, but it *sounded* that way.

On the SW77, I completely eliminated the interference by using its
synchronous detector to select upper sideband.

On the R75, I couldn't tell any difference between AM and S-AM. The circuit
seems to be engaging, since when deactivating S-AM, I can hear a
faint pop.

I did note that the R75 did a much better job of holding the signal during
fading, but it did so regardless of whether S-AM was active.

The R75 is a great radio for me, but I just don't understand the difference
some of you guys are hearing when you say that S-AM is working well for you.
What exactly am I missing?

Leigh Hanlon
Chicago, USA

hi Leigh:

i have a different take: no receiver is designed perfectly. fortunately the R75's flaws have been identified and resolved. Dr. Rado was kind enough to create the Sync-AM mod. i did it and now SAM sounds great!

even with its flaws the R75, for me, is the lesser of many evils. the R75's immediate competitors lack even basic features such as an RF gain, PBT, or RS232 control... some are missing keypads or an FM mode, are oversized, have QC problems, poor displays, or aweful buttons and knobs. some units costing twice as much do not have 1 Hz tuning steps, DSP noise reduction, or a DSP notch filter. mods to fix any of these flaws would be extremely difficult (aka it's just not going to happen).

phil :)

No Phil, I don't find it useful cause I can't read it. I have
fallen behind on computer technology since I sold my Commodore 64 a
long long time ago. I just depend on the manufacturer pack of
installed software. Think I'll get ahold of the IT guru at my job
and see what he can do for me. Thanks...

Dennis,
I believe the AT-2000 is for receive only but the Mizuho KX-QRP is for transmission. Look at the following site for a picture and evaluation of the KX-QRP: www.qsl.net/ku4qd/mizuho/kx.html I remember that the KX-QRP is more widely available than the AT-2000. I believe the sites I mentioned in my other post have the KX-QRP available for sale and costs a few dollars more than the AT-2000. Good luck.

HI Friends:I have both mods and the Phil's fidelity mod is better by
far.With a super high frequencies response range.An is a very easy
mod to do [only {4} 47k "SM" resistors in parallel].And as an extra
with the fidelity mod the DSP performance
improve.

Nevertheless, I can hardly ever hear distortion on fading signals on my R75. Sure, it's true that AM and S-AM perform virtually the same, but in either mode it's a LOT better than the sync AM on my old Sony 7600G ;) The main problem with my R75 is fading. When listening in AM mode you can hear the fading, so for many broadcasts I just listen in SSB mode. This seems to be an AGC thing though, not a sync detector problem. regards, Rik -- Bravely reimplemented by the knights who say "NIH". http://www.surriel.com/ http://distro.conectiva.com/ Current spamtrap: october@...

They admit the Kiwa mod fixes it. It certainly helps.

> What exactly am I missing?

Nothing - the point is that the AM is already so good that it is
practically synchronous. Mods may clean up the sound, but the synch works
fine.

And as we've pointed out, when the R75 is placed next to a non-S-AM radio,
there is significant difference. The R75 does not distort during fades as
do the others where the synch is obviously off.

Maybe the bigger gripe here is that, on the R75, you can't get straight AM, ONLY synch! :-)

This is true, but Passport also mentions more than once that after-
market companies (i.e. Kiwa) can fix this, and they wonder why Icom
itself has not done the very easy fix.

With the Kiwa mods, this is a 5 star receiver, especially considering
the cost differential between the R75 and its competitors
(Drake, ...).

Reducing fading is one of the features that a good synch am detector provides. A good synch circuit will reinject a carrier that is locked to the weak carrier present. This eliminates the fading you describe (the R75 does not exhibit deficiencies in the AGC) The R75 is deficient in SAM as it comes from the manufacturer, as discussed in Passport, and evidenced in my personal testing. Try comparing the R75 to a receiver that has a good SAM (say, a WJ8711 or TenTec 340 or NRD 535 or R8A/B or R7/A or even the venerable 2010 from Sony). To improve the R75 SAM, try the mods previously described, or get an outboard SE-3. YMMV Don Nelson 8711A/8712P/1000A/rx340/r590a/535D/R7/R75/DR333/RX320/545/2010/YB400PE ----- Original Message ----- From: "Rik van Riel" To: Sent: Saturday, November 02, 2002 7:38 AM Subject: Re: [icomr75] "Passport" still faults R75 S-AM On Sat, 2 Nov 2002, saucerchaser wrote: > Here's what the 2003 edition of "Passport to World Band Radio" has to say > about the R75 and S-AM: > > --> "The Icom R75's sync is virtually useless." > > --> "Synchronous detector virtually nonfunctional." Nevertheless, I can hardly ever hear distortion on fading signals on my R75. Sure, it's true that AM and S-AM perform virtually the same, but in either mode it's a LOT better than the sync AM on my old Sony 7600G ;) The main problem with my R75 is fading. When listening in AM mode you can hear the fading, so for many broadcasts I just listen in SSB mode. This seems to be an AGC thing though, not a sync detector problem. regards, Rik -- Bravely reimplemented by the knights who say "NIH". http://www.surriel.com/ http://distro.conectiva.com/ Current spamtrap: october@... George,

Well that takes a lot of explaining-suffice to say I live in FL and in a Deed Restricted community.

My house has extra wide eaves and soffets (as most do in FL) so I dropped a stand off 14" below my gutters and strung the Eavesdropper (as a dipole) between the standoffs. So far the "Deed Restriction Police" have either not noticed or are ignoring it. My next step is to raise it about 10' and see how much attention I attract.

Try an Eavesdropper C. I've been using one for six months with excellent results. The antenna element is 42' long(mountable in many configurations) and over all about 45'. They are available from many sources-just look them up on the net.

John P.,
What did you use before you installed the Eavesdropper and how did it compare to it? Which direction is the Eavesdropper installed? Sounds like your antenna is about 7 to 8 feet from the ground, is that right? I too live in Florida but my problem is my lot; although it is 1/2 acre, it has a lot of trees, front and back, which makes it almost impossible to get to a height above the trees, and difficult to string a 45 foot length horizontal antenna since branches are just about everywhere above 10 feet - I could probably locate some clear spots at about 12 feet high and maybe 15 feet in a limited area. My concerns with the antenna are height and direction: I didn't think I would be able to achieve an acceptable height i.e.20 to 25 feet. I also wanted to obtain signals from the east and west so I assume I need to string it north to south; based on your installation instructions for the Eavesdropper, does this seem right to you (minimum height and direction)? Yet, when I read Joe Carr's Antenna Handbook, it seems that most signals from far away are not directional anyway.

2661. Re: [icomr75] Passive Outdoor Antenna

Yahoo group: icomr75 (2000 — 2002)
Date: 2002-11-02 19:16:39 UTC
From: John Pickrell
Topic: 2647 Message: 2661

George,

To start, I have a Sangean roll-up and a Sony AN-LP1. The signal increase over both was at least 2 S units but the significant increase in performance came in the noise reduction (dipole antenna/common mode rejection?)-at least another 1-2 S units.

Physically, my antenna installation is far from desirable, it's only about 7' off the ground-that's why I want to raise it (Deed Restriction Police permitting). It is oriented NE/SW and I have good performance to Easter Europe/Russia, the Middle East, and northern Africa. I lack performance to the continent of Africa, Indo-Asia, and the Pacific rim. Occasionally, I can get Australia/New Zealand. Central, South America regions also perform well. My big disappointment is the western US, west of the Mississippi is down in the mud.

The way my house is built (concrete block) the antenna is shielded to the West by the way they cap walls down here-18" of concrete with re-bar. So without going to a beam, no trees etc, raising the antenna 7'-10' is the best I'm going to do (unless someone else out there has any suggestions).

George,

Another thing, actually two, the Eavesdropper C is automatically tuned by trap circuits and therefore requires no antenna tuner. It also comes with a gas-discharge tube (static discharge) device. So all things considered at $80.00 it's is not a bad deal.

John,
You're right, and the 2002 edition of Passport to World Band Radio rates that antenna as being very good. Does the installation instructions provide a recommended height? The instructions for the dipole I'm now using in my attic recommends 25 feet.

Try an Eavesdropper C. I've been using one for six months with excellent results. The antenna element is 42' long(mountable in many configurations) and over all about 45'. They are available from many sources-just look them up on the net.

I am looking for a good (not perfect)passive outdoor antenna which doesn't take much space. Is there such a thing as a passive loop antenna? All of the loop antennas I've seen advertised are active.
George

George,

Yes, and I quote, "The Eavesdropper is designed to be suspended with the center of the antenna about 25' above ground." They also state that it can be installed as a horizontal dipole, sloper, or inverted "V", additionally, they go on to state that the ends may be bent into a "U", or "Z" configuration and "The Eavesdropper will still work very well in even the most compromised locations."

Hope this answers most of your questions. I recently converted to Windows 2000 Pro and have no driver for my scanner or I would scan the directions and shoot them off.

John,
You're right, and the 2002 edition of Passport to World Band Radio rates that antenna as being very good. Does the installation instructions provide a recommended height? The instructions for the dipole I'm now using in my attic recommends 25 feet.

John P.,
What did you use before you installed the Eavesdropper and how did it compare to it? Which direction is the Eavesdropper installed? Sounds like your antenna is about 7 to 8 feet from the ground, is that right? I too live in Florida but my problem is my lot; although it is 1/2 acre, it has a lot of trees, front and back, which makes it almost impossible to get to

a height above the trees, and difficult to string a 45 foot length horizontal antenna since branches are just about everywhere above 10 feet - I could probably locate some clear spots at about 12 feet high and maybe 15 feet in a limited area. My concerns with the antenna are height and direction: I didn't think I would be able to achieve an acceptable height i.e.20 to 25 feet. I also wanted to obtain signals from the east and west so I assume I need to string it north to south; based on your installation instructions for the Eavesdropper, does this seem right to you (minimum height and dir

George,

Well that takes a lot of explaining-suffice to say I live in FL and in a Deed Restricted community.

My house has extra wide eaves and soffets (as most do in FL) so I dropped a stand off 14" below my gutters and strung the Eavesdropper (as a dipole) between the standoffs. So far the "Deed Restriction Police" have either not noticed or are ignoring it. My next step is to raise it about 10' and see how much attention I attract.

John P.,
Thanks for the info. If I can't locate 45 feet horizontal space at 25 feet height, I'll stay with my indoor dipole. My intention was to improve reception over my dipole by using an outside antenna. Doesn't look good for me using the Eavesdropper, and I don't want going to an active antenna.

hi Don:

the R75 does exhibit AGC deficiencies but in the AM mode only. ICOM implemented the Motorola MC13022A 'Advanced AM Stereo Decoder' chip using a 10 uF external capacitor (fast AGC setting). this over-rides the relatively slow AGC design of the receiver. Dr. Rado fixed this by adding a 220 uF capacitor, thus negating any ill-effects.

SAM is stuck in a "tuning mode" which has "very fast" (no whine) PLL locking. Dr. Rado describes adding a capacitor to introduce hysteresis (or lag, causing "slow lock") as well as a resistor to add bias (or base level, preventing loss of lock during fades).

IMO purchase of the SE-3 is unwarranted. i performed Dr. Rado's Sync-AM and AM-AGC mods, and my own AM fidelity, AM filter, and ECSS volume mods with <$25 in parts. using my soldering technique, the time involved is minimal.

i agree with you: Passport correctly faults the stock R75's SAM mode. considering the importance they place on SAM, did Passport give a rating for a Kiwa-modified R75?

i notice you have some premium receivers... have you tested them side-by-side against a modified R75? if so, any findings are welcome. a friend of mine who frequents this board has done such testing... i am sure he too would be interested in any commentary.

regards,
phil :)

==========

You might try a DX 10 from universal.com. I believe it is
an RF Concepts antenna. Its a 7' high helically wound antenna.
It is rather pricey at 199.95$. Has built in impedance matcher
so you wouldnt need a tuner or anyhting else.

Jeff

Sorry about that,, the antenna I was thinking of is called the
MTA by RF systems. The DX 10 is an amplified version which Universal
doesnt sell. Go to Universal.com and go to the online catalog and go
to the SW antenna section and scroll down to you see the RF systems
section and there you'll see the MTA, along with some others. The MTA
is supposed to be good from 500kc to 30mhz. The other models are for
a different frequency. I dont think Universal has that in their catalog,
which they havent updated in a while.

Indeed, this is an AGC fix; I posted to this group some time
ago reporting that the normal AM mode is in fact already
quasi-synchronous detection, hence the similarity between
AM and S-AM.

I think Larry Magne does his reviews by looking
at the specs and doing a quick, half-hour test, rather than by
understanding in depth each receiver. His review of the
Wellbrook ALA antennas is similarly superficial.
Such superficial reviews were valuable in the pre-internet era,
but now one can find much better opinions online.
To my dismal, ARRL does even more superficial reviews (weren't they
supposed to be the professionals?
The site with the best "general" reviews seems to be Radio
Netherlands, at the moment.

Peter

I don't understand why Passport simply does not 'rate' a Kiwa
modified R75. All it takes is two lines to say that we tested a
modified one, and here is what we think.

Passport's tests are done by Sherwood Engineering, where some
data can be found too (http://www.sherweng.com).

Did anybody buy R75 online recently? I'm nearly ready to order
one, but just wondering whether I can get the UT-106 at the same
time I receive R75 - earlier posts suggest long delay for UT-106.

BTW, any suggestion about trusy online dealers?
Many thanks.

hi Pine:

i purchased my R75 from KJI. the owner, Gene, is very knowledgeable
(he is a ham and electrical engineer) and he specializes in ICOM.
last i heard his price for the R75 with DSP was ~$530. he services
what he sells and is based in NJ. give him a call, he has great hours
and is available from noon to 5 pm on sunday nov 3 (tomorrow). ask
him about the DSP unit... he shipped mine with the receiver.

http://www.kjielectronics.com/

regards,
phil :)

How did you modify the rabbit ears for the R75? I've got a rabbit ear antenna and live in an apartment.
Does anyone make an indoor whip that works with the R75?

I just bought an R 75 on Ebay using the "buy it now" feature. Once I contacted the seller, I found that I was dealing with KJI Electronics which is a ham radio store operating since 1978 in Caldwell NJ. Called the owner, Gene K2KJI to verify my bid and the R75 arrived 5 days later. Enclosed with it is the UT106 dsp unit. No screwing around with coupons, waiting, etc. Gonna install it today. The best part is it cost $75 less than the best price I have found. The unit is brand new. I bet the cost of a phone call might just yield the same deal to others. He can be reached after 1300 EST at 973-364-1930. Closed Wednesdays. Website is www.kjielectronics.com.

The only reason that I can think of is, it's been modified. If you look at all the adds in passport. You'll see that all, if not most, of the units is right out of the box. If you want to do a comparison, have a magazine company like Pop Comm. or Monitoring Times do one. That's I think would be my only explanation.

I have the 1026 unit and it removes local interference very good. My unit is modified. Some components removed to make it work on the AM band as well. Now it is good above 750 kHz, below that gain is a little low.

The amplifiers is a little noisy, sensitivity is reduced when you use the 1026, but perhaps good enough when you have a lot of local noise.

The potentiometers for the phase and gain controls are lo quality!!

Whoa... I can't let that slide.

A couple years ago I ended up in a fairly lengthy email exchange with Larry and one of his testers. The issue was conflict-of-interest, and Larry got involved because I referenced his magazine as a potential conflict of interest. You see, the tester I'm referring to is Robert Sherwood of Sherwood Labs.

What was interesting was that the reviews were put together in multiple steps -- a purely bench-test review by Sherwood followed by, I think, 4 people who used the radio under test in different parts of the world. For the SE-3 tests, according to Larry, Sherwood himself isn't involved. Larry cited the example of adding the SE-3 to an R8-B as being a poor investment. But the point is, that the radio under test gets discussed by these various people and Larry writes the review. The tests are non-trivial and take time, and putting the final report together before deadline gets kinda hairy.

You'll notice that they rarely retest a radio for incremental improvements; only when there's a known dramatic improvement.

Another thing you'll notice -- apparantly something Larry insisted on when working for WRTH and continued with PWBR, is that the review section does not have ads in it -- there are plenty of ads throughout the book, but not among the reviews.

> His review of the
>Wellbrook ALA antennas is similarly superficial.
>Such superficial reviews were valuable in the pre-internet era,
>but now one can find much better opinions online.

Keep in mind PWBR's audience: People who want to *listen to international broadcasts*, regardless of technical ability. This, of course, means that an outstanding UTE receiver with mediocre AM performance is going to get poorer ratings than a good AM-only receiver.

I don't recall the Wellbrook review mostly because I don't buy antennas; I'd rather build them. Which year is it in so I can save on my "find the books" search? (I haven't received the

2003 edition yet. Monday, hopefully.)

>To my dismal, ARRL does even more superficial reviews (weren't they
>supposed to be the professionals?

ARRL seems to operate in great fear of offending advertisers but
I don't think I'd call their reviews superficial. Especially when
(as an ARRL member) you get the in-depth reports off the web or by
mail.

>The site with the best "general" reviews seems to be Radio
>Netherlands, at the moment.

Indeed, they are very good reviews. Very businesslike, whereas the
PWBR and ARRL reviews are written in a more "folksey" style. The
former may be just because of the target audience. The latter...?
dunno. Read "The Amateur Amateur" column on their web site for an
example of this taken to the extreme. I find myself saying, c'mon,
you didn't really do this, did you? (Again, the amateur amateur is
aimed at the person who has made mistakes he's too embarrassed to
admit to, so I can understand it in that case.)

IMO you pegged this right on the nose Eric. i've done 5 mods on my R75. know what 4 of these mods gained me? better AM sound quality... but i can still hear any station using SSB.

some pick up Road-and-Track and say: "i need to pay $50,000 for a car that does the quarter mile in 13 seconds". others pack a centrifugal supercharger into a camaro. some pick up Passport and do the same. in the world of electronics being able to solder has its advantages.

Hmmm, I kept hearing it was the power steering that didn't work, and
that the car was in 5th gear the whole time everyone thought it was
in 4th. :-)

The point is, the radio doesn't do what it claims to do out of the
box, no matter how you slice it.

I was going to wait until I had a look at a schematic, but what the
hay... I rearranged my shack and now instead of 2 8500s inside with
an R-75 as my "portable," I switched one of the 8500s with the R-75.
The end result is that I can comfortably test over long periods the
two side-by-side.

I note that the R8500 performs no better and no worse in terms of
fading and distortion during AM listening, and for those who don't
know, the 8500 is renowned for having low distortion AM. The 8500
has no sync-AM at all.

My point is that I don't buy the S-AM is on all the time argument.
Comparing the R-75 to a portable "shouldn't" be fair -- that is,
there is no reason to expect the R-75 to not outperform a DX-398 in
any respect whatsoever. A more fair comparison is against the Lowe
HF-150, and the 150 beats it, hands down, when comparing DSB S-AM.

The '75 is a good radio, but without the mods, it doesn't live up
to expectations that one should have, pulling it from the box.

I have the 1025 (1026 w/o whip + amp). As Gert mentions; local interference is effectively nulled out (TVI, chargers, PC's, lamps, you-name-it...). I don't have any experiences regarding phasing, using long antennas, but I can successfully null out dominant Euro-powerhouses on MW even with short wires (<10m).
The pot's are crap (especially the Phase pot would easily burn out). I've replaced them with Spectrol (cermet type) pots.
Modifying the unit for switching the main/aux antennas with a dtdp breaker is a cheap & good investment.

OOPS! I meant to say I paid $529 "buy it now" on ebay. Just saw
another one up for bid from the above company. It is under
ebay-amateur radio-receivers
same deal $529 with free dsp

de KB0XR Bob in Minnesota

This would be OK, but honestly, they should just admit a minor problem,
fix it in all new runs (R75A), and offer to tweak the old ones for a
modest cost. Maybe even free, but that might be asking too much.

Passport often does compare modified against unmodified radios and grants stars accordingly (they love the Sherwood mods, with good reason); I do not believe Larry M. got a Kiwa- or Rado/Phil :-)modified version for comparison, however, because apart from mentioning that the mods help, he offered no revised star score.

As I mentioned earlier, however, if it doesn't have selectable sideband synch, it'll never get better than about 4.5 stars even if it runs circles around everything else in every other respect. That, for Larry, is the Holy Grail of radios.

Note - Radio Netherlands granted both the R75 and the Drake R8A four stars at their website, even with the noted S-AM, AGC and minor sound deficiencies in the R75, and a minor adjustment for the R75's somewhat lower price (they assume the full price of $799). RN is willing to recognize the strong points of a radio apart from S-AM, both regular and sideband-selectable. For some decent improvements (even without testing the radio) they gave the sideband-selectable R8B five stars, probably a fair value. For $100 worth of mods, the R75 might do as well.

But I would very much like to see what these guys would give it with the mods done. Speaking only for myself, I find the performance quite amazing.

Maybe your last sentence explains why. Kiwa is competition for Sherwood
in making sure a S-AM circuit works.

To All,

I don't know about the rest of you guys (and Girls) but I think this horse has been beat to death.

For those of you that feel slighted by ICOM's apparent refusal to "own up" to a problem-get over it.

I see three alternatives to the above group: modify the radio, use it as is, or get rid of it-but in any case quit your "belly aching."

Now I've said my piece.

Yes, that could very well be it.

I don't have the 2003 Passport. Does Kiwa advertise in it, or has it
ever advertised in Passport?

> any respect whatsoever.

Yes, agreed, but selective fading is NOT a function of the radio, but rather of the ionosphere, and without S-AM, oughtn't the radio get the same serious distortion regardless of it's quality? If you take a Collins R390 and pit it against the '398, nobody is going to quarrel about which is better - but both are going to sound crummy during a deep fade. When the S-AM is *on* on the R75, you won't find a non-S-AM radio that'll *sound* as good, even if the radio is generally a better radio. Mind you, this does not say anything about sensitivity, selectivity, audio amp power, or other factors.

> A more fair comparison is against the Lowe
> HF-150, and the 150 beats it, hands down, when comparing DSB S-AM.

I assume this is out of the box - I have no doubt, then, that this is true.

Recall, too, that the AGC and the audio chain on the R75 are a bit flaky; fix these, and you may find the DSB S-AM on the R75 compares more closely with the Lowe. IMHO, fixing the AGC on the R75 is the biggest single favor you can do your radio and yourself.

The only way you are probably going to see any ads would be through a magazine company. The ads in passport, as to what I see it as, is the stock machine. The one magazine that I'd recommend doing it would be "Monitoring Times". There's my ten cents.

2718. Re: [icomr75] phaser use

Yahoo group: icomr75 (2000 — 2002)
Date: 2002-11-04 21:17:45 UTC
From: Johan Letterstål
Topic: 2668 Message: 2718

There are two types of PCB's, with discrete components (1025) and SMD's (1026). It's possible that 1025 also was designed and built w SMDs. Nevertheless...
For the MW mod: Just snip & lift one side or if SMDs: break(!) them with a plier.
No components needs to be added.

Thanks Johan I'll check out when the unit arrives, but I suspect surface mount components. I intend to mainly use when we head bush during our winter months. I like to experiment with Bevy's & the KAZ Delta loops. Also what do you use for antenna pre amplification.

Johan - Thanks, and BIG question for you:

If the MW sensitivity mod is performed, will this make the unit more susceptible to creating images/harmonics on the HF/SW bands? That is my biggest concern, as I live in a large urban area (San Francisco) and I have dozens of MW/AM stations close to my home -

Thanks,
Bruce Jensen

The newest 1025 are SMDs now - I had one I upgraded last year.
Its very easy to crush the SMD devices to remove, as you'll never want to return to the unmod config

>comparison, however, because apart from mentioning that the mods help, he
>offered no revised star score.

For those of you that have never used an SE-3, give it a try -- it works, and works very well.
It even helps premium receivers such as the wj8711/wj8712P/hf1000A (which has no selectable synch sideband) and the tentec rx340 (which happens to have the selectable synch sideband).
Gosh, thats another $600 on top of a $4K to $7K receiver. Why'd anyone do that?
<ANSWER: because it works well>

And as to the Kiwa mods - Craig is in a move transition from his current location to across the state.
He does not sell modified receivers (but Sherwood does!), he only modifies your receiver for you.
Since the radios reviewed for Passport may be on loan, or owned by the reviewers, an upgrade may or
may not be possible. Here's a thought - you could offer Larry the use of your improved version to test.

>As I mentioned earlier, however, if it doesn't have selectable sideband
>synch, it'll never get better than about 4.5 stars even if it runs circles
>around everything else in every other respect. That, for Larry, is the
>Holy Grail of radios.

Whoa. Can't let this one get through.
Check the your copy of Passport again - see 2003 pg 159. Your argument here is specious.

>Note - Radio Netherlands granted both the R75 and the Drake R8A four
>stars at their website, even with the noted S-AM, AGC and minor sound
>deficiencies in the R75, and a minor adjustment for the R75's somewhat

>sideband-selectable. For some decent improvements (even without testing
>the radio) they gave the sideband-selectable R8B five stars, probably a
>fair value. For $100 worth of mods, the R75 might do as well.

Comparing the R8B to the R75, in my opinion Passport 2003
got it right. (I've got one of each and have done the comparision, including a modified

R75)
The R8A might well be equivalent to an R75 (but I don't have an R8A to compare. There were significant changes between the R8B and the R8A)

>But I would very much like to see what these guys would give it with the
>mods done.

To what end?

Is it going to make your program listening any better? Certainly won't
make any difference to a serious DXer. And giving any receiver a 5-star rating to a personally
modified R75: how does this help the average person who is going to make a decision on purchasing a radio (without having to worry about making all the mods?)?

Frankly, keeping the pressure on ICOM to make improvements is a desireable outcome of not getting 5 stars. (It worked to get some improvements on the 545 and is working to get the TenTec 350 improved. Last year's review of the RX-340 netted a bunch of improvements
in the latest ePROM upgrade). Why take the pressure off ICOM? Lets get the SAM and AGC fixed by the factory. Why should the buyer have bolt on a turbocharger?

>Speaking only for myself, I find the performance quite
>amazing.

Face it, you and I are owners of a "Camaro-class" receiver. Tricking the Camaro up with a turbo and new paint surely produces
amazing performance as well. (The Camaro is a classic car but its not a BMW nor Mercedes nor a Formula 1 racer.). The R75 is good
value for the money but its not a NRD nor AOL nor WJ nor TT340.

Don

(I drive a number of receivers. I have no financial affiliation with Sherwood, although I am a satisfied user of his SE-3. I have no
financial affiliation with the publication known as Passport, nor do I have any affilitiation with any receiver manufacturer nor
purveyor of equipment). I personally rate the receivers I have tried in this order:
wj8712P /SE3
wj8711/HF1000A /SE3
TenTec 340 /SE3
R390A /SE3
R590A /SE3
Collins 2050
Cubic 3030A /SE3
R7A /SE3
R8B
535D (modified by Kiwa)
DR333
545
R75
RX320
2010

YB400PE
PCR1000
And these are rated in order of usability in weak signal DX work. Try for instance Mangarrai on 2960.02 or Ngada on 2899 or AIR
Gangtok or some of the very weak Andeans or separating AIR on 5050.02 from China on 5049.92.

YMMV

See the thread on rec.radio.shortwave called, cleverly enough, "Radio."
I got mail from IBS -- the publishers of PWBR -- and posted it there
with their permission. They couldn't get the Kiwa mods done because
of the move, but they plan on doing so. Sounds like they bought several
R-75s for their tests.

That is true... but at least the R-75 doesn't scream "I'm a drug
dealer and dating a 14 year old" like a Camaro does... :-)

I don't understand why people insist on treating the R-75 as if
it could do no wrong... it's a radio -- an excellent bang-for-buck
radio, but that's it. It doesn't outclass any other radio I have.
And the "best" of mine have notorious flaws as well. I'd like
better, but can't afford it now, so I'll go on, clear eyed, about
what, after all, is a piece of electronic equipment, nothing more.
Stop worshipping the bloody thing!

(R-8500x2, R-75, FRG-7, R392, HF-150, plus sundry V/UHF xcievers, HTs
and scanners.)

hi Don:

IMO passport's ratings are right on the money considering their target audience. when i got back into this hobby i contemplated purchasing a "5-star" unit but i expected better buttons, better display, better tuning dial, 1 Hz tuning steps, optional filter slots, DSP noise reduction, etc.

> The Camaro is a classic car but its not a BMW nor Mercedes

here too 'ratings' often become a moving target...

"my BMW is better because it is faster than your camaro"
"really?"
"yes it says so on page 25 of road and track magazine"
"i am running a centrifugal blower with 7 psi of boost"
"what's that mean?"
"it means in a race you will lose"
"my BMW is better because it has a cool front grill"

phil :)

Topic: 2636 Message: 2727

howdy Bruce!

although the R75 has no single button or phasing capability, a single sideband can be selected during SAM. engage SAM and the dual 2.4-kHz filters and detune (+) 1.2-kHz for USB or (-) 1.2-kHz for LSB. this filter method (also used during SSB) is extremely effective at adjacent channel rejection. detuning places the window of incoming bandwidth overtop the carrier and one sideband... the other sideband is chopped off by the filter. the carrier is so strong [with ~2/3 of the power being dumped here] that Motorola's AM Stereo chip can still maintain lock.

find a station with one sided interference: ex. 2010 kHz USB has noise. switch to SAM and 2.4-kHz filters, detune to 2008.8 kHz (LSB component) and the noise will be attenuated. this also works with the 6 kHz filter (although it is asymmetric)... just tune away from the noise checking to make sure lock is maintained: keep the 'S-' in SAM from blinking. [note: 'SAM SW' must be set to 'En' in the setup mode].

phil :)

2728. R75 S-AM and automobiles

Yahoo group: icomr75 (2000 — 2002)
Date: 2002-11-05 07:21:28 UTC
From: Leigh Hanlon
Topic: 2728 Message: 2728

Several members have compared the situation regarding the R75 to an automobile. Submitted for your approval:

An automaker produces a classy, finely tooled car that is gorgeous to look it, handles like a dream, has a great price tag and low APR factory financing. This vehicle is advertised as coming equipped with an "innovative" five-speed transmission.

When you shift the stick into fifth, there's a definite vibration that suggests *something* has gone on, but the transmission clearly doesn't move into the higher gear.

Despite several reviews in credible, objective automobile magazines noting the transmission deficiency and suggesting an inexpensive fix, the manufacturer fails to acknowledge there is a problem and continues to advertise the "innovative" transmission.

Owners have varying opinions on this issue.

One group says this is a fine car by any standard, and that the transmission problem isn't that big a deal.

A second group is mechanically inclined and is willing to go down to Pep Boys and buy an aftermarket kit, even though installing it voids the vehicle's warranty.

A third group is convinced that the car actually *does* shift into fifth gear, but that it does this so smoothly that inexperienced owners simply are unaware of it.

The subject currently is being beaten to death on a Yahoo! Group devoted to this car.

Leigh Hanlon
Chicago, USA

>
>
phil :
Yes Phil:That's what I did.I stop complaining about the flaws.I took
a look in to the files in this group and some of your projects [like
the Phil's fidelity mod] and did the easy mods and now I have a truly
performer R-75. Cost? Less than $10.00.After that I went for a 3.3
filter, cost? $7.00.The stock R-75 in SSB is very good,but if you
want to outperform some big guns receivers in the under $3,000 range
go for the easy mods and a 3.3khz to 4 khz filter.That's all that you
need for now.Remember that all receivers have flaws, all.There is not
a perfect receiver in any price range.But the difference is that with
the R-75 you can fix it with very easy mods available.

Well, I suspect the mod would have a negative effect on strong signal handling on MW.
I'll pass this question to Gert Nilsson et al. I believe Gert has more experiences in this area, using 1026 + long antennas. I use the phaser mainly for nulling local QRN, using short antennas. No intermods or MW artifacts has been found on SW.

There is an interesting article by Bjarne Melde (Norway) comparing MFJ and Wellbrook APU.

From: Jim Hackett
Topic: 2732 Message: 2732

As far as I'm concerned, all the bickering that goes on about what Passport says or doesn't say about the R75 means NOTHING to me. I don't care what someone that owns a Drake thinks about it. I couldn't be happier with mine! I don't NEED reassurance from ANYONE to feel good about the decision I made. I fell victim to the hype with the Sat800 back in April. Had it for less than a week before I realized it was less than a bargain at the price of $500. The R75 is MUCH more radio for a few bucks more. The 800 would be a "great" radio at $300. The 75 IS a "great" radio at $600! The fact that there are many mods available only tells me this is a highly loved receiver.
I don't need to convince ANYONE the R75 is a great receiver, I KNOW it is, and that's ALL that matters!

That's fine, and I concur - although I understand from some I've spoken with that it roughly equals the NRD535 and beats the 525, in general.

I don't, and I don't think it outclasses anything except maybe radios with far fewer features. I just (mildly) object to people denigrating it when it actually functions quite well. My S-AM works beautifully, the audio is perfectly understandable (as well as any SW set I've ever had), and I can many hear weak and distant stations. My only limitation is my antenna and my locale, which for me is a constant source of irritation.

My fundamental problem in this regard is my antenna and location. They will never be suitable for this type of work :-(Having the finest radios made would be a waste here. I do receive some weak Andeans and Pacific rim stations (1 kW RRIs are fairly common in fact), but not well.

Thanks, Gert and Johan - I use mine primarily for local noise reduction on HF, so I think I'll leave the MW attenuation in there.

They probably wouldn't accept because they'll want one straight to/from
Kiwa. Suppose they *don't* like what they find and report it as Kiwa's
"fault?" Puts them in legal hot water.

They have a year to get one... presumably it won't take that long for
Kiwa to get up and running.

> couldn't be happier with mine! I don't NEED reassurance from ANYONE
> to feel good about the decision I made. I fell victim to the hype
> with the Sat800 back in April.

Indeed... well, I fell victim to the R-75 hype, too, which is why I
react badly to it. S-AM works all the time, you are just to stupid
to know? C'mon... give me a break! I know better because I did
side-by-side tests with several radios. Such nonsense and blind
product/manufacturer worship is NOT helpful to prospective purchasers.

Mods like those froom Phil and Rado are helpful, by contrast.

> The R75 is
> MUCH more radio for a few bucks more.

That it is. No argument there.

> The 75 IS a "great" radio at $600!

No. The 75 is a great radio VALUE at $600. It still is only a good radio.

> I don't need to convince ANYONE the R75 is a great receiver, I KNOW
> it is, and that's ALL that matters!

That may suit you. But to me, it has repeatedly fallen on its face on
many fronts. Mostly because I expected it to live up to the hype that
surrounds it. Ultimate rejection? blech. S-AM? Arrgh. Stability?
Try and use it in a car. It does have an auto-mounting bracket available,
y'know. But the temperature swings in a car that don't faze my 8500
knock the 75 silly. The 8500 is a better radio, but certainly not a
better value.

Meanwhile, I recall how Phil reacted when he did the S-AM mod... I
expect that if/when he buys an AOR 7030 he'll have the same "holy carp!"
reaction. As, I expect, you would, too.

In the meantime, had I known then what I know now, I would have
saved my money and accumulated a bit more to buy an AOR 7030+.
Others, such as yourself, would rather not spend that kind of coin
and for you the '75 is an excellent value and a fine radio for what
YOU use it for.

In the mean time, I reiterate what I said earlier: Don't worship it.
Respect it for what it is, but don't forget what it is not. Prospective

buyers who come here for advice will be grateful, and those who buy one,
warts and all, won't be disappointed by what they get.

2741. RAE Argentina heard last night 0000 onward

Yahoo group: icomr75 (2000 — 2002)
Date: 2002-11-05 20:16:13 UTC
From: bpnjensen
Topic: 2741 Message: 2741

Hi, folks - just a bit off-topic, but Peter L. asked about when I was able to hear this station. Tuning in last night at 0000z through about 0200z, RAE Buenos Aires was received with a fair signal about SINPO 34323 variable on 11,710 kHz. Propagation was pretty quivery, but I could underdstand the sound of the words being said (even though it was, apparently, in Portuguese, and not Spanish). There was a good deal of talk about Brazil. An English broadcast began at about 0200z, but by that time the propagation had changed and China was starting to interfere severely on that freq.

Under the circumstances, it would have been hard to QSL. FWIW, Radio Nacional from Brasilia was heard quite well on 25 meters last night at about the same time, with clear Portuguese being spoken, about SINPO 44434. Also heard FEBA Seychelles, Oman (BBC), Sri Lanka (VOA relay), and AIR India on several outlets. A fun two hours :-)

Hello
I'm a new member to this group as I just bought a R75 last Sat. at
Ham Radio Outet in Salem NH. It came with the UT-106 as a icom promo.
I printed Phils Cookbook and have found it very helpful, I attemped to
set up the filters and am confused to what to set the filters for
AM Wide
SSB Narrow
I am not very knowledgeable on modern radios, in the past I have
used older tube sets and a Kenwood R-2000 which didn't have any filter
setting other than normal and wide.
As time goes on I'll probably ask some dumb questions so thanks for
any help in advance.
Are there any users in Southern Maine?
Thanks
Dan Weston

Stability?
Ultimate rejection in the R-75 is very good.In my R-75 the S-AM with
an easy and cheapy mod that I did using a 339 comparator work ok,
when is needed.I never had problem or had read about anyone with
stability problems in his r-75.
>
> Meanwhile, I recall how Phil reacted when he did the S-AM mod... I
> expect that if/when he buys an AOR 7030 he'll have the same "holy
carp!"
> reaction. As, I expect, you would, too.
Phil did the fidelity mod [that improve the DSP performance too],
sync mod and add a 3.0khz filter and now he don't need a AOR 7030+
and save about $900.00.Not a money issue but a performance issue.The
AOR don't have DSP and the R-75 in sensitivity is better and with the
fidelity mod there is not audio issue between both .
> In the meantime, had I known then what I know now, I would have

> YOU use it for.
Yes the R-75 is an excellent value,and a excellent performer radio
and after mod it with all the easy mods available online the R-75
surpass receivers that cost a lot more for MW, SW, and 30MHZ to 60mhz
signals reception..
> In the mean time, I reiterate what I said earlier: Don't worship
it.
> Respect it for what it is, but don't forget what it is not.
Yes it's not a basic radio for beginners.
> buyers who come here for advice will be grateful, and those who buy
one,
> warts and all, won't be disappointed by what they get.
Yes for inexperienced prospective buyers is best to start with a
portable or something like the Sat 800, a very easy to work with
radio.But if they are looking for a tabletop with Pro features like
DSP,1hz tunning step,Up to 60MHZ tunning range,super sensitivity and
a lot of easy and cheapy mods and filters availables to upgrade it
for like Pro performance and at the same time save hundred of dollars
no question about it they need to go for a R-75 with dsp a "super"
receiver and bargain.

> > Respect it for what it is, but don't forget what it is not.
>Yes it's not a basic radio for beginners.

Some day, I hope you get to try a radio that is really not a basic radio. This sort of blind worship is exactly what I'm talking about. Someone comes here to learn about this radio and every post says how good it is -- someone like me! -- and they find out it is a mediocre performer after they purchase it.

It cannot even stand up to an antique FRG-7! Be realistic. This isn't a WJ, not a Ten-Tec of any flavor, not a Collins, not a Drake. Not a Lowe or an AOR.

What it is is a box with a lot of features on a fair receiver with an excellent price point. You can 1 Hz step and PBT all you want, but when the entire dial is sprayed with MW overload, as mine is, those features mean nothing.

You think it's so bloody good, do you want to buy mine? $350+shipping. I cannot in good conscience ask any more than that. BTW, phil already turned me down.

no conspiracy here: passport rated the R75 the same as the NRD-545SE
and better than the RX-350, R8500, Palstar, FRG-100, RX-320. btw, how
many more signals do you feel you'll hear on say a $4000 RX-340 verus
a $300 RX-320... might want to ask Al.

> when the entire dial is sprayed with MW overload

ICOM has a MW filter before the passband filters in the R75. your
antenna is the problem. as i recall you needed 40 dB of attenuation
to get it working on an R8B. did you go over to the Drake board to
tell them too?

> BTW, phil already turned me down.

i already have a radio... but someone will get a bargain.

QST magazine reviewed the '75 in the Jan 2000 issue.

PDF online -- I can summarize, but you can get a reprint faxed to
you for a nominal cost -- I've done that before. www.arrl.org

I suspect that IBS will have a white paper available soon, if not
now. www.passband.com A quick look at their web site doesn't show
it. Furthermore, there aren't many current receivers available, so
I don't know what their white paper future is.

Radio Nederland has a review with specs distributed through it.
They're always a good source of info on receivers:

www.rnw.nl/realradio/icr75.html

Again, if you want me to quote the lab measurements from ARRL's tests,
I can do that, but it's a lot of typing...

Hi, phil,

The answer is, of course, that I don't. But my *personal experience*
ranks it below the R-8500, the R-392, FRG-7, FRG-100 (closest) and
HF-150.

Now, all of those radios have areas where they are deficient to the '75;
for example, the HF-150 is far more prone to front-end overload. However,
overall, they all rank above the '75.

The AOR 7030 and Drake R8-B rank above the 75 by everyone's measure. I
don't own either, but did get a chance to play with the Drake (see below).

The AOR AR-5000 and ICOM R-71A both are used as professional surveillence
receivers. I had a chance to play with an R-71A, and it was impressive.

The WJ 8711/HF1000? TT RX340? Racal anything? Collins anything?
be serious. Not even in the same league.

>no conspiracy here: passport rated the R75 the same as the NRD-545SE
>and better than the RX-350, R8500, Palstar, FRG-100, RX-320.

For program listening, and almost certainly based on bang/buck as well.
Note the comment about the R8500. I also would disagree with Larry on
that one because I have them side-by-side now.

> btw, how
>many more signals do you feel you'll hear on say a $4000 RX-340 verus
>a $300 RX-320... might want to ask Al.

Increase in price and capability don't have a linear relationship and
you know it. I have never not stated that it wasn't a good value. It
just isn't up to several tasks, among them my specific application, for
which the '8500 handles with aplomb.

Bob Parnass is a user of the '8500 and the NRD545. Ask him about the
two vs. the R-75...

> > when the entire dial is sprayed with MW overload
>
>ICOM has a MW filter before the passband filters in the R75. your

>to get it working on an R8B. did you go over to the Drake board to
>tell them too?

Nope -- I don't own a Drake, so there's no point. If someone asks me
about the '8500, I'm not shy about discussing its flaws, either. It
is a responsible thing to do.

And, yes, the Drake overloaded on that antenna, too, but needed much
less attenuation for it to clean up, and it did so abruptly. The '75
needed a LOT more attenuation before it began to show signs of cleaning
up. The '8500 just works.

> > BTW, phil already turned me down.
>
>i already have a radio... but someone will get a bargain.

"There is not such thing as Too Many Radios!"

Seriously. If the one you are using isn't suitable to what you are doing,
you have an option to try. Sweet AM? the 392 or 8500. Ute? 8500 or '75.
Bad fading? HF-150 or ECSS on the 8500 or R75. Major world event?
Coverage from more than one source simultaneously. (When Princess Diana
died, I wanted to hear it from the BBC and other European sources before
I would believe it. A more serious event such as operations against Iraq
would also be useful to hear from, say, a news source along with AF
freqs.)

Next on my shopping list is probably a 7030+. I hope I don't find the
ergonomics -- its weak spot -- to be too much of a hemmoroid.

Well, the long version of the story is that it is one leg of an abandoned V-sloper, fed as a long wire using an ICE transformer, on a radio quiet zone where ground conductivity was enhanced by a large grid of chicken-wire and ground rods every few feed. Boresighted down the end of that wire, approximately 80 miles away, is a 50 kW daytime station. Everything below 10 MHz is wiped out, completely, unless the attenuator is on. If you try to use the preamps, kiss any useful reception good bye.

The wire is approximately 1000 feet long.

I have used the Drake R4B, Hammarlund HQ180, Collins R390A, ICOM R71 and ICOM R75. At the moment I use the ICOMs side by side. Not very big difference in performance. The R75 is a little more sensitive. I use these receivers with long beverage antennas (1000 meters) and preamplifiers ahead of the receivers. I never experience any crossmodulation on the R71, sometimes I have to switch of the internal preamplifier of the R75. The R75 is much easier to use, so often I search for stations on the R75 while I record another station on the R71.

I have also had a 7030 side by side for comparison. Not very much difference except that the 7030 have greater frequency response in the AF stage and that the R75 is a little better on very weak stations. I have sound samples for those interested.

The AOR AR-5000 and ICOM R-71A both are used as professional surveillence receivers. I had a chance to play with an R-71A, and it was impressive.

> better on very weak stations.

i am VERY interested in the sound samples. i can do some spectral analysis on them. after doing my fidelity mod the R75 sounds excellent on music. btw, did you hear the sound sample i put up? there are minor downsides (less so with the 100k-ohm solution) including the SSB may need to be tightened by tweeking the PBTs [aka you cannot rely on the AF filters for bandwidth control, no biggy]. once you hit the DSP you kill everything above 5 kHz because of the unit's 10,000 Hz sampling. i NEVER expected ICOM's DSP to be sampling up this high... a very pleasant surprise... overdesigned! the DSP also functions better now... i suspect because of all the highs... and the sound is not as attenuated. please send or upload your sound samples. thank you.

regards,
phil :)

Aha! This certainly explains why you are gettig the MW overload
problems!

At 1000 ft, your antenna is probably more efficient at MW than SW!
For instance, it resonates at 3/4 wavelenghts for ~740 KHz!!

May I ask, why are you using such an antenna for shortwaves?

If your belief is that "the longer, the better", then you should
know that this is not true. It is a long story, but essentially,
a single, long wire, once reasonably long (over 1/6 wavlength or so),
will not pick up any more signal if even longer.
All will happen is that you have a standing wave on the wire.
If you want to pick up a stronger signal, put elements in
parallel (Yagi, Quagi), build antenna arrays, or use some
other similar solution.
But I would argue that, given the level of atmospheric noise, and
the sensitivity of modern radios, you don't need for reception to
do anything fancy in a radio quiet zone.
I could go on for some time elaborating on
these points, but a good book on antennas may be the better
resource.

What you are doing with such a long antenna is boost the MW
reception. You should use that antenna for MW, but NOT for SW.

You are spending thousands of dollars on radios. In my
opinion, you should also pay equal attention to your antennas,
making sure that the spectral sensitivity and S/N performance
of the antenna matches the frequencies you want to listen to.

Your antenna gives a huge MW overload, while being no more sensitive
for SW than a normal (dipole, random wire) antenna.
You then have to use strong attenuation to get rid of MW overload,
decreasing the SW signal as well.
From the SW point of view, your antenna is equivalent to a
standard dipole or random wire antenna, followed by a 40dB
attenuator!
I would not be surprised if I, with my 3ft-diameter loop antenna
in the noisy SF Bay Area, can actually receive fainter signals
on SW than you can.

All the best,

Peter

From: ptrlmpn
Topic: 2647 Message: 2756

I know that this is not what you asked for, but:

I am in a similar situation (lots of trees), and I am very happy
with my Wellbrook ALA 330 active loop.
Sure, it is active, but why don't you like active loops?
A passive loop of that size would have far too low signal output.
And loop antennas tend to pick up less noise, other things
being equal, and they are very effective even when
placed closer to ground (as a bonus, less worry for
lightning strikes).
If you like, I can email you a photo of my installation:
I simply attached the ALA 330 to the fence, and it works
very well.

Peter

> What did you use before you installed the Eavesdropper and how did
it compare to it? Which direction is the Eavesdropper installed?
Sounds like your antenna is about 7 to 8 feet from the ground, is that
right? I too live in Florida but my problem is my lot; although it is
1/2 acre, it has a lot of trees, front and back, which makes it almost
impossible to get to a height above the trees, and difficult to string
a 45 foot length horizontal antenna since branches are just about
everywhere above 10 feet - I could probably locate some clear spots at
about 12 feet high and maybe 15 feet in a limited area. My concerns
with the antenna are height and direction: I didn't think I would be
able to achieve an acceptable height i.e.20 to 25 feet. I also wanted
to obtain signals from the east and west so I assume I need to string
it north to south; based on your installation instructions for the
Eavesdropper, does this seem right to you (minimum height and
direction)? Yet, when I read Joe Carr's Antenna Handbook, it seems
that most signals from far away are not directional anyway.

Blind worship is to start to talk about radios that you never
own.Play with a radio in a radio store or try a radio in the internet
is not a true test. Blind worship is also not to learn about
antenna's arrangements and theory before attempting to report about
receivers performance.Antenna performance is one part geography and
geology,one part technology,one part installation.
> > Someone comes here to learn about this radio and every post says
> how
> > good it is -- someone like me! -- and they find out it is a
> mediocre
> > performer after they purchase it.
Mediocre for someone who don't know how to use a good antenna for
each band with it.I have a K9AY outside loop for MW and a random wire
150' for shortwave.
> > It cannot even stand up to an antique FRG-7! Be realistic. This
> isn't
> > a WJ, not a Ten-Tec of any flavor, not a Collins, not a Drake.
> Not a
> > Lowe or an AOR.
The R-75 is more sensitive than the AOR 7030+ and Drake R8
series in the shortwave band..After the sensitivity mod is more
sensitive in the MW band than the AOR,DRAKE, and run side by side
with the big guns Collings, WJ, and ten-tec 340.

> > What it is is a box with a lot of features on a fair receiver
with
Only your biased oppinion If you check WRTH,passport and other
reviewers you will go to find something like this :"oustanding
rejection" "Excellent rejection of spurios signals,reception of
utility and ham
signals as well as world band signals""excellent sensitivity to weak
signals,pretty good audio with outboard speaker" this is in page 141
of 2002 passport R-75 review.In the WRTH 2000 page 33 "strongly
recomended,best value tabletop receiver, its compares exceedingly
well with the R8B[drake]".Not so bad for a "mediocre" receiver as you
call it.Do you ever try it side by side for weak signal reception
with a drake R8B as I did day by day for 3 weeks?Or with a rascal
6790?Or with a
Aor 7030+? And remember the passport and WRTH R-75 review was with a
stock
one.Can you imagined what could happened if they use a mod R-75 one?
> excellent price point. You can 1 Hz step and PBT all you want, but
> > when the entire dial is sprayed with MW overload, as mine is,
those
> > features mean nothing.
Yes if you use a 1000 feet ant without a good foundation in ant
theory and installation knowledge sure that will be the result.
You think it's so bloody good, do you want to buy mine?
> $350+shipping.
> > I cannot in good conscience ask any more than that. BTW, phil
> already
> > turned me down.
Phil is an intelligent guy .He is learning very fast and put the
solder gun where he put his words.Now after he did the mods he have a
truly performance receiver with a working sync det, upgrade in the
DSP performance,super sound,good sensitivity and a filter installed
without
any soldering a 3.0khz filter [cost $7.00] for very good
selectivity.An now he have a quantum loop ant for MW because he know
that before talk about the receiver performance YOU NEED TO WORK WITH
THE ANT FIRST.

2758. AM Loop Antenna

Yahoo group: icomr75 (2000 — 2002)
Date: 2002-11-06 13:41:07 UTC
From: Erine
Topic: 2758 Message: 2758

FYI: Radio Shack has their AM Loop Antenna on sale for $19.99. It is normally $29.99 and is said to work as well as or better than the $69 Terk model. They are out of stock online, and I had to go to 3 RS's to find one. It works great on the broadcast band and covers up to 1700 kHz. This is a good deal. Catalog # is 15-1853

Good luck

2759. Re: [icomr75] Re: Dead horses?

>
>May I ask, why are you using such an antenna for shortwaves?

Actually, I rarely do. I primarily want to use it for below 500 kHz
stuff, but the receiver is utterly saturated there, too.

>If your belief is that "the longer, the better", then you should
>know that this is not true. It is a long story, but essentially,
>a single, long wire, once reasonably long (over 1/6 wavlength or so),
>will not pick up any more signal if even longer.
>All will happen is that you have a standing wave on the wire.

I agree and do, believe it or not, understand. Although there are
people who disagree with this, it certainly can be the case that
you end up with destructive interference.

However, one of the interesting things about using this wire is that
the 14.1 MHz ham propogation beacons usually ALL come in cleanly on
a single cycle through. One would not expect that... I certainly didn't.

>If you want to pick up a stronger signal, put elements in
>parallel (Yagi, Quagi), build antenna arrays, or use some
>other similar solution.

Well, the short version is that this wire was already in place.
One of the reasons for the chicken-wire ground plane is that the
place is practically a rock. I've even found one ground rod where
the guy who put it in simply gave up on pounding it into the rock
and cut it off at ground level.

Now, the things I'd "like" to do are to play with a T2FD out there --
there's a dipole test facility with two towers and ropes to ajust the
height of the endpoints. There's also about 16 LARGE LPDAs out there
I'd like to try, but unfortunately they are mounted on wooden poles
with some rot at the bottom. The other 4 LPDA poles have come crashing
down on their own.

>But I would argue that, given the level of atmospheric noise, and
>the sensitivity of modern radios, you don't need for reception to
>do anything fancy in a radio quiet zone.
>I could go on for some time elaborating on

>these points, but a good book on antennas may be the better
>resource.

Thanks, I have several, both beer-n-pretzels level and antenna theory
level. :-)

>What you are doing with such a long antenna is boost the MW
>reception. You should use that antenna for MW, but NOT for SW.

...and LW, as I stated below.

>You are spending thousands of dollars on radios. In my
>opinion, you should also pay equal attention to your antennas,
>making sure that the spectral sensitivity and S/N performance
>of the antenna matches the frequencies you want to listen to.

Absolutely, there's no doubt that the antenna is the most cost-effective
improvement you can make to any system. As for the radios, well... they
just kinda accumulated over the years, most of them through opportunity.
The R-75 I purposely bought to be my "in car" radio for going out to
this site. Previously I'd untangle my 8500 from all that it is wired to
and haul it out.

>Your antenna gives a huge MW overload, while being no more sensitive
>for SW than a normal (dipole, random wire) antenna.
>You then have to use strong attenuation to get rid of MW overload,
>decreasing the SW signal as well.
> >From the SW point of view, your antenna is equivalent to a
>standard dipole or random wire antenna, followed by a 40dB
>attenuator!

Yes, but the point is that other radios handle the situation better.
On LW, MW, and, yes, SW.

>I would not be surprised if I, with my 3ft-diameter loop antenna
>in the noisy SF Bay Area, can actually receive fainter signals
>on SW than you can.

With an R-75? I would agree. I'd also like to take a box loop out
there for LW stuff to see how it fares. BUT: Other radios have
better front-end protection. If I ever get so loony as to take my
R-392 "hernia maker" out there, I guarantee you it'd have no trouble
with overload. I know how the 8500 would fare, but I was hoping to
not haul it out there because of the aforementioned dealing with it,
the discomfort of having that expensive a radio in the car, and,
frankly, its own weaknesses in places where the R-75 is superior.

>All the best,
>
>Peter

Peter, while I may not entirely agree with you on everything, the
sane, rational response is MOST welcome! :-)

Cheers,

Eric

2761. Re: [icomr75] Re: Dead horses?

Yahoo group: icomr75 (2000 — 2002)
Date: 2002-11-06 14:37:09 UTC
From: Eric F. Richards
Topic: 2732 Message: 2761

At 01:20 PM 11/6/2002 +0000, you wrote:

> Blind worship is to start to talk about radios that you never
>own.Play with a radio in a radio store or try a radio in the internet
>is not a true test.

No, the R8B was in my hands, in the field, thanks to a very generous
owner. The R71 I had played with for several days.

Your point has merit w/ respect to radios like the '7030 and the others
I listed. However, I think that in the cases of the radios I mentioned,
no one -- NO ONE -- disagrees on their performance and capabilities.
(Other aspects, such as ergonomics, are more controversial, but I digress.)

However, in the case of the R-75, it is an ongoing issue that just never
dies. Note the subject line. :-) Note all the discussion insisting that
the Sync-AM works, even when you don't know it works.

Face it, the capabilities of the R-75 *are* controversial. Phil's and
others' mods to the radio are great things, but there are some people
like me, who simply don't have steady enough hands for surface-mount
work.

You can blame the antenna, the ionosphere, the laws of physics for being
so unfair, but the end result is that when I go chasing LW beacons I
cannot do it with this radio, while others fare better.

> Blind worship is also not to learn about
>antenna's arrangements and theory before attempting to report about
>receivers performance.Antenna performance is one part geography and
>geology,one part technology,one part installation.

...and 100 parts physics. This antenna was not built in a vacuum,
y'know... it wasn't even built by me, and it is one of the smaller
ones on that site. FCC regs require radio stations to shield the
radio quiet zone with their antenna patterns.

> Mediocre for someone who don't know how to use a good antenna for
>each band with it.I have a K9AY outside loop for MW and a random wire
>150' for shortwave.

And for LW? A box loop? A Beverage? (Terminated or not?) Read Joe
Carr's books, particularly his "Practical Antenna Handbook" which is
his mathematical/theoretical book, despite the "practical" in the
title.

Also, read up on DXpeditions -- you'll find that 1000 feet of wire is
nothing for those guys. Yet somehow, they get them to work on SW, MW

and LW without problems. Their secret? Receivers with solid front-ends.

> The R-75 is more sensitive than the AOR 7030+ and Drake R8
>series in the shortwave band..After the sensitivity mod is more
>sensitive in the MW band than the AOR,DRAKE, and run side by side
>with the big guns Collings, WJ, and ten-tec 340.

Sensitivity. Means. Nothing.

Once you are below the ambient noise level, more sensitivity is
irrelevent. Selectivity, dynamic range, ultimate rejection, filter
width and shape factors... those are more important.

> > > What it is is a box with a lot of features on a fair receiver
>with
>Only your biased oppinion

Yes, but not a prejudicial opinion -- one based on personal experience.
With several antennas. Under different working conditions. As I type
it sits next to the 392, 8500 and FRG-7 all off a *passive* 4 way
splitter/isolator. Note that with 8dB loss introduced by the splitter,
each radio holds its own with respect to sensitivity.

But other issues remain.

> If you check WRTH,passport and other
>reviewers you will go to find something like this :"oustanding

>recomended,best value tabletop receiver, its compares exceedingly
>well with the R8B[drake]".

Best VALUE tabletop receiver. Please find a message where I wrote
that it wasn't a great VALUE. For that matter, please find a message
where I did NOT write that I thought it was a great VALUE.

In terms of bang-for-buck, it can't be beat. In terms of ultimate
performance, it falls short.

>Not so bad for a "mediocre" receiver as you
>call it.Do you ever try it side by side for weak signal reception
>with a drake R8B as I did day by day for 3 weeks?Or with a rascal
>6790?

A "rascal" 6790? No, I didn't want to have to chase the thing around
the house and keep yelling at it to stay out of my 'fridge. :-)

No, I couldn't test for 3 weeks against the R8b. But I can compare
it to what I have now, and have done so for over a year.

>Or with a
>Aor 7030+? And remember the passport and WRTH R-75 review was with a
>stock
>one.Can you imagined what could happened if they use a mod R-75 one?

I'm sure that PWBR will give it a good review for *program listening*.
Heck, the R-71A was notorious for its lousy AM sound. But I'm not
using it for program listening, predominantly. I'm using it for LW.

>Yes if you use a 1000 feet ant without a good foundation in ant
>theory and installation knowledge sure that will be the result.

Which still qualifies as a "random" wire at the frequencies I
use it for. Now if the tower the apex of the sloper is fastened
to were safe to climb, I would restore it (and its twins) to
V sloper configuration as travelling wave antennas. But it isn't
possible, so I use it as I can. I know full well the weaknesses
of its "design" as it stands. But, I'm not using it as you think
I am.

> Phil is an intelligent guy .He is learning very fast and put the
>solder gun where he put his words.

Yes, phil is an intelligent guy -- intelligent enough to not deserve
condescending treatment!

>Now after he did the mods he have a
>truly performance receiver with a working sync det, upgrade in the
>DSP performance,super sound,good sensitivity and a filter installed
>without
>any soldering a 3.0khz filter [cost $7.00] for very good
>selectivity.

But that does nothing for the problem I am having.

>An now he have a quantum loop ant for MW because he know
>that before talk about the receiver performance YOU NEED TO WORK WITH
>THE ANT FIRST.

And I hope to use a loop for LW as well, because it's rather hard to
rotate the wire to change its directivity... :-)

Even so, with my inferior, poorly thought out, crapola design antenna,
my R-8500 shamelessly shrugs off the overwhelming MW signal and lets
me chase all the LW beacons downrange from the wire.

Clearly the 8500, the antenna and the universe is at fault. But not
the R-75.

NOTE TO LISTOWNER -- if you want this subject to be dropped, I will do
so immediately upon a private mail from you. However, I think discussion
of the R-75 should include the good, bad and ugly. Out of such discussion

comes solutions, if there are any. Such as the mods.

2762. DIY Loop antennas ?

Yahoo group: icomr75 (2000 — 2002)
Date: 2002-11-06 14:57:44 UTC
From: Paulo Ferreira
Topic: 2647 Message: 2762

Has anyone seen the loop antennas projects in EPE magazine?

Link: http://www.epemag.com/projects.html

August 2001

Compact Shortwave Loop Aerial:
This Q-multiplied loop amplifies signals and nulls out electrical
interference. Four plug-in loops covering 1.5MHz to 30MHz

September 2000

Active Ferrite Loop Aerial: (For MW)
Superbly designed vertically and horizontally rotating reception optimizer.

In both cases they use among others one BF981 Mosfet, and they have a
bypass switch, and varicap tuning.

Any ideas or links about active or passive loops?

I have already seen the RNW MW DX guide.

Greetings
Paulo Ferreira

P.S.: This message has nothing against horses, dead or alive. The author
likes horses very much, among all kinds of animals. :-) :-) :-) :-) :-)

I won't argue here (but see discussion below). If you're in a MW-rich area, as I am (and apparently Eric is), there are, at least sporadically, lots of MW products on the bands up to about 5.5 MHz, which can be annoying when you are using a good antenna for the tropical bands.

OTOH, I've never noticed anything, really, from MW or HF above about 7 Mhz. Clean as a whistle. Now, oddly, when I place a PAR high-pass MW filter on the radio, which cuts MW by about 50 dB, it doesn't help eliminate those products, and it should (I guarantee you, that filter cuts those MW signals down to size). This leads me to believe that there may be some wierd diode thing in my antennas rectifying those signals at odd frequencies, allowing them to bypass the filter altogether. So in fact, it may be my antennas and not the radio that is causing those problems, or at least the antenna may be partly to blame. I would suggest to anyone condemning the radio for spurious products that, if there is rust or corrosion or some poor bimetal contact anywhere in your system, there may be another cause.

> > > Respect it for what it is, but don't forget what it is not.

> good it is -- someone like me! -- and they find out it is a mediocre
> performer after they purchase it.

I disagree. I still believe that, even with those MW products in the way, that I am only limited by my antenna and location. This is not worship (give me a break - talk about hyperbole), as I do not claim it to tbe the be-all and end-all of receivers. The three most critical things a receiver needs - good sensitivity, good selectivity and low noise floor - are all there in the R75. Frankly, at my location, no radio is going to be able to work to its potential, so I also cannot claim to have the best basis for an opinion on any radio - but I cannot imagine any other radio giving me better performance under my local circumstances.

> turned me down.

What did you expect? One is really enough of any radio.

You're right, it isn't perfect - but in terms of value per dollar spent, especially at its typical going price, it is hard to beat. That is the point, my point, and even you agree above.

These are my final words (for now) on this matter.

There must be a White Paper on it - no?

Radio Nederland didn't seem to find any problem with these specs in
general, IIRC.

IT may not come as a shock, but many AM stations are also known to transmit those harmonic monstrosities due to poor transmitter maintenance, etc - and no radio will attenuate those. Not saying the R75 is suffering from this, but - it is another factor that may be beyond the radio's (any radio's) control.

As I recall, QST gushed over the R75 - which probably was overboard. They seemed to blindly accept the claim that the S-AM was working as expected out of the box.

I swapped the FRG-100 for the R75. Apparently you and I have different experiences, because it was a major step up by my reckoning. I can hear and copy stations on my R75 that were *impossible* on the FRG.

The only Passband white papers for current receivers are those on the
Drake R8B, Grundig Satellit 800, Sony ICF-2010, and Yaesu FRG-100.

I will look up the QST article today and may summarize portions on
this forum.

Sensitivity means nothing? This is certainly true if you live in high noise area. But if you use beverage antennas in very quiet locations the sensitivity is very important. For daytime reception of transatlantic stations over here in Sweden extra amplification is really needed. I use 15 dB extra most of the time + the internal preamplifier and have perfect readability despite no movement of S-meters!

By the way:

I think the longwire is a perfect antenna for tropical shortwave reception. It is very directive, gives about the same signal strength as a dipole (or some dBs more) and can be erected as low as 3-6 meters for good performance. The dipole for 60 meter band should be 30 meters high for best performance.

About overloading of the R75:

Something must be totally wrong with your R75. It is absolutely impossible to overload the shortwave with a AM band signal. I have tried connecting my signalgenerator to the antenna input in parallell with my outdoor antennas and I can hear nothing from it more than 30 kHz from the modulated carrier.

I have a 600 kW station just across the Baltic Sea in Finland about 500 kilometers away anf have no problems. A friend of mine has his receiver in the shadow of Radio Sweden 1200 kW transmitter on 1279 kHz. No problems. (He tried a NRD545 but sold it.....)

Yeah. The '75 hasn't worked out for me, and so it really isn't
worth anything to me at this point.

Yup. Where is your S-meter sitting on a quiet section of the HF
band? everything you read there is noise. If you can't hear it
above the noise, or if you can't filter the noise out, you're
wasting effort in amplifying it.

The respected AOR 7030 has sensitivities in the 0.5-0.6 uV range.

Th R-75 plays mostly in the 0.15 uV range.

This is from Radio nederland: http://www.rnw.nl/realradio/rx_testing.html

> especially on long-, medium-, and short-wave up to 10 MHz, the

> high. But all this does not say much about the receiver.

The above figures were from ARRL. Here's what RN had to
say about the 7030: http://www.rnw.nl/realradio/ar7030.html

> Sensitivity
>
> The sensitivity figures are fine. Remember that the atmospheric-
> and man-made noise is very high on shortwave and sensitivity is

More important, up to a point. That point being the noise floor.

> For daytime reception of transatlantic stations over here in
> Sweden extra amplification is really needed. I use 15 dB extra
> most of the time + the internal preamplifier and have perfect
> readability despite no movement of S-meters!

I'm interested in your specific catches -- do you have 'em
logged?

>
> About overloading of the R75:
>
> Something must be totally wrong with your R75.

I have considered that.

> It is absolutely impossible to overload the shortwave with a AM band
> signal.

Be careful of "absolutes." I tried to get a good reading on what the
antenna was doing with a spectrum analyzer, but was unable to do so..
What was the strongest signal level you tested your R75 to?

> I have a 600 kW station just across the Baltic Sea in Finland about
> 500 kilometers away anf have no problems.

Frequency? If MW or above, you are out of ground-wave range, so
lack of overload isn't going to be a problem.

> A friend of mine has his receiver in the shadow of Radio Sweden
> 1200 kW transmitter on 1279 kHz. No problems. (He tried a
> NRD545 but sold it......)
>

Now THAT one interests me. Can you give me a field strength reading
in uV/m? What about an RF voltage off his antenna and antenna
configuration? (Don't worry, I have to borrow the equipment to do
that, too, so if you can't, I understand.)

It doesn't even have to be in your antenna system. It could be re-
radiated from anything nearby, such as a rusty fence, etc.

hi Paulo:

one of my MW antennas has a Q-multiplier... it is like having a bandwidth tightening control! loops are great for attenuating man-made noise... the R75 is very sensitive (plus you can get an active loop) so a clean signal is more important than an overly strong one IMO. at SW frequencies loops are not as directional but they can still block out local noise.

> Any ideas or links about active or passive loops?

see link at bottom for SW loop to give ideas...
http://www.torustuner.com/

mostly medium wave loops...
http://www.hard-core-dx.com/nordicdx/antenna/loop/index.html

*** HULA HOOP LOOP *** for regular AM but good for ideas...

Eric, do you mean your case, my case (which I meant), or all cases?
Meanwhile, I will look for the item you suggest.

Bruce Jensen

Hi Eric,

Have you done spectrum analysis of the signals comming from that big beverage antenna? Your experiences with R75 and other radios are kind of strange. There may be some huge signal on some odd frequency that resonates the R75 front-end (some of the bandpass filters or the transformer for the high impedance antenna input ANT2).

Best regards,

Rado

Another point. If I remember correctly R8500 uses relays to switch input filters, R75 uses diodes. There are also some protection diodes accross the antenna input. If the signal is so huge as to be above the switching voltage of the protection diodes then R75 will be really swamped. And a question - how did you power the R75? From a battery, generator or inverter?

Regards,

Rado

The '8500 uses both relays and diodes.

I did go out there with a spectrum analyzer that petulantly refused
to work below 1 MHz, and the primary suspect in interference is at
670 kHz.

I did a writeup of my attempted analysis on rec.radio.shortwave:

Subject: R75 front end overload (chapter n++)

Yes. :-)

I was referring to my case, but the whole idea of trying to find
oxidized junctions in a sea of chicken wire will make you go postal.

When WWVB was doing their upgrades, there was apparantly some construction
equipment or tools that had a non-linear junction because one night a
member of a local monitoring net mentioned that he was hearing this
"really bizarre CW" at 180 kHz. Turned out, of course, it was WWVB and
it was spraying waay up the dial and the harmonics were very strong
at my location in Boulder, quite some distance from the transmitter
in Ft. Collins. One of the members of the net knew one of the on-site
engineers out there and called him about it, but it reappeared sporadically
until the upgrade work was done.

I found the FRG-100 to be basic but very capable. My biggest beef
with it was chuffing and phase noise. The lack of keypad didn't
hurt at all, for me, and, aside from the very clean PLL on the 8500
I replaced it with, it wasn't too bad.

Car battery, through a filtered cig ltr plug. Car always turned off.

hi Eric:

i know you are a smart guy and personally i've enjoyed these discussions. i wish there were more debates on the Palstar and RX-350 boards where i lurk (hear that guys... i know you lurk here too :p). Peter's explaination makes sense. i was not savy enough to piece together what was going on but needing 40 dB attenuation in front of an R8B, i knew something was awry. i am having a lot of success using indoor loops for both MW and SW. i am still a novice in many regards (on MW i am a big novice compared to someone like Gert). for LW i would probably do the MW attenuator bypass mod and add a LPF to attenuate the BCB.

IMO there are a lot of myths surrounding receivers. first, like natural selection, all the current tabletops are survivors... they all fill a niche. rankings in magazines are subject to opinions. specs, features, cost... facts. IMO the best overall performing non-professional radio is the 7030+... still more people in our hemisphere purchase the R8B with its good performance and ergonomics.

IMO the R75 is a great SSB radio: dynamic range is 103 dB, for $100 you can get a filter with a shape factor of 1.6 and >90 dB of ultimate rejection, the front end has 1.6 MHz H/LPFs and 8 bandpass filters, the synthesizer [IMO the hardest part of receiver design] has phase noise better than the RX-340 and WJ8711. after the sync-AM, AM-AGC, and fidelity mods the R75 is a great AM radio as well.

phil :)

This is a great discussion site. I usually weed through the comments & use what ammounts to the useful stuff for my areas of interest. I'm into MW band dxing. trans pacific, asian you name it. We love experimenting with loop antennas, bevvy's Delta loops. but when it came down to what I could afford for a receiver, here in OZ the r75 had no peers. I've done the am attenuation mod, and now use the set, with well balanced & fed antennas to enjoy, may it be limited to some degree, what I enjoy hunting for. I know the phaser will add more excitement to my listening.Cheers to all

That's good, that *someone* out there isn't fed up with me! :-)

Smart? Lots of smart people out there who can't figure their
way out of a wet paper bag at times... but I'll take the compliment
anyway!

>Peter's explaination makes sense. i was not savy enough to piece
>together what was going on but needing 40 dB attenuation in front of
>an R8B, i knew something was awry.

Well, that experiment actually suggested causes other than external
modulation products. There was a *very* sharp cutoff between the
point where the receiver was buried in intermodulation products and
it was operating cleanly. Either 1 dB or 3 dB. The R-75, you may
recall, was much "mushier" in its cleanup, with something like 10-15 dB
between when it "started" to clean up, and when it was completely clean.

As you may recall from my usenet postings, I still need to get out there
with working instruments to make some good measurements. Unfortunately,
the spectrum analyzers I have access to are all HP-141Ts, which are
gawdawful heavy, and a Singer calibrated field strength meter owned by
a friend isn't much different. Like the last time, a test with these
will require some logistical and people coordination. (1 to be crushed
by the '141T, one to call 911 and a crane operator to lift it off...)

> i am having a lot of success using

Yeah, I've used one of Dale's LPFs successfully out there. The
secret, BTW, is to *follow the directions* and fasten it *directly*
to the back of the receiver; no coax jumpers at all.

>IMO there are a lot of myths surrounding receivers. first, like
>natural selection, all the current tabletops are survivors... they
>all fill a niche. rankings in magazines are subject to opinions.
>specs, features, cost... facts.

True. But specs are like statistics -- they can be made to lie, too.
Almost anyone who does testing on receivers -- ARRL, PWBR/IBS, RNW --
has an article going over their testing. ARRL, in particular, points
out when a manufacturer publishes specs measured in a non-standard way.
They raised an eyebrow at the AOR 7030's reported specs, for example.

The other thing is that you have to be careful about what you measure.
Most testing, for obvious reasons, measure dynamic range with two signals
close together -- that's the obvious problem. My situation is more
unique, and therefore is not tested for normally.

> IMO the best overall performing non-
>professional radio is the 7030+... still more people in our
>hemisphere purchase the R8B with its good performance and ergonomics.

...and the R8B is a better deal here than outside the U.S.

>IMO the R75 is a great SSB radio: dynamic range is 103 dB, for $100

Don't get me wrong: I do think the R-75 has its high points. Very
good behavior on a lot of fronts, excellent price point, etc, etc...
you've heard me say it before. But great? not in my book. "Great"
is an opinion and a great receiver does what I want it to all the
time, no matter how unreasonable it is. :-) There are receivers I
have -- and would find -- to be "great" but all of them cost a lot
more. To many readers here, that is the bottom line.

How about a non-linear junction in the car itself?

2801. Re: "Passport" still faults R75 S-AM

Yahoo group: icomr75 (2000 — 2002)
Date: 2002-11-07 16:22:54 UTC
From: LarryR
Topic: 2636 Message: 2801

Last night, on a badly fading BBC, I compared S-AM with normal bandwidth, S-AM with narrow (2.4kHz) bandwidth shifted with PBT, S-AM narrow bandwidth de-tuned by 1.2kHz, and ECSS.

normal S-AM had the usual fades into unintelligibility

both narrow methods definitely reduced fading distortion. The PBT method worked as well or better than the de-tuning method and is easier. It seems to me that selective fading is bound to be less of a problem the narrower the bandwidth - the AGC is less likely to be fooled by strong sidebands overpowering a weak carrier.

I did not think to switch S-AM to AM with narrow filtering to see if synchronous matters. That's an obvious ommission I will try that tonight.

ECSS was by far better than the other methods. Much less distortion, and it allows me to use my 3.3kHz SSB filter. Even with Expanded Filters ON, I cannot select the 3.3kHz filter in AM.

From: dukeofbecker
Topic: 2802 Message: 2802

I'm a newbie to this group, and I plan to buy a r-75 soon....I'm about to take the plunge into more serious listenting, so please be kind!

I wonder about the two pre-amp stages...How does this feature work? What is the purpose of this feature?

I guess you can pick optional and separate filters for each stage, depending on your listening needs. I know how and why wider/narrower filters change signal quality, but how do you determine which stage to put them on?

I'm confused....

Certainly possile, bug the problem has been observed in more than
one car and outside of a car as well, so despite the multiple
opportunities for there to be problems introduced by car junctions,
it doesn't seem, on the whole, to be likely.

Larry, i believe you're right. ECSS nukes fading because the strong internally generated BFO replaces the carrier. note: you may want to also experiment with turning the AGC off.

> Even with Expanded Filters ON, I cannot
> select the 3.3kHz filter in AM.

i believe you should be able to select this for AM but not SAM. please try this: select AM [NOT SAM, see below]... depress 'FIL' 2 seconds... check EXP is 'oN' and set oP1 to '257'... select 15 kHz and 3.3 kHz for narrow... press 'FIL' to exit.

i believe ICOM's algorithm will NOT let you select 3.3 kHz if you enter the filter selection routine in the SAM mode! switch to plain AM and then try adding the 3.3 kHz filter.

My pleasure. If I get the time I will post comparative figures from
the JRC NRD-545, RX-320, and Palstar R30 too (all ARRL measurements).
It seems like ARRL never tested the Drake R8B.

From: just_rtfm
Topic: 2798 Message: 2811

> > > My main gripe with the R75 is that the standard
> > > 6KHz AM filter is not very steep.

Peter, what is the reason for wanting the steep filter? the reason i ask is that often using SAM and detuning (or PBT as Bruce pointed out) [as an aside my tests show the BPT is +/- 1.3 kHz] will get rid of lots of adjacent interference. if you want a steeper filter for use under AM just follow my AM filter mod; however, this will not work under SAM. another option for AM/SAM is the 2.1 kHz filter from InRad for the 9 MHz IF... shape factor is 1.6... only $100. you could replace the standard 6 kHz AM filter but it is a desoldering nightmare IMO. the best option may be to learn from my mistakes...

this brings me to important lessons i have learned: attenuator, pre-amp, and RF gain settings are critical to filter efficacy. feed your filters weak signals so they can do their job. with enough amplification you can even get blow-by wherein the ultimate rejection of the filter (say -70 dB) is still too little to stop noise. the goal is to reduce the gain (and shift the PBT/detune) so that the signal passes but the noise does not because it is too weak.

sounds simple but have you ever tuned to a strong station and everything seems great... 5 minutes later you notice some noise. you get annoyed only to find that just kicking in the attenuator is enough to kill the noise completely... even if it is on the same frequency. what else can we do? lay off the pre-amps... and reduce the RF gain... even if this means odd s-meter readings or having to crank up the volume (AF). the RF gain is not a volume control! the RF gain is very important to the functioning of all the filters. we do the mods and then we forget we have an RF gain or that we can shut it off.

using the 2.4 kHz 9 MHz filter (aka narrow, this is a good filter with ~1.70 shape!) on SAM with the above tips does wonders. less bandwidth means less noise... if things are bad all we need is the low frequency audio to understand voice. realize that you can often go further than the PBT and remain in sync while using SAM by just detuning. i detune 1.2 kHz and then use the PBT for cleanup. detuning can even be used with the 6 kHz filter engaged if one side is clean.

IMO i learn best by purposely finding stations that sound bad and practicing or by testing techniques on a very strong station just to see their effect. this way when i want to hear something important i already know my options.

phil :)

Perhaps we could manage the space better.

For example, 25% of the space is used by TWO copies of the same audio file.

Also, we have 30 MB of space for photos, mostly unused. All the pictures in the files section could be moved to the photo section.

There are also many duplicate files. A little housecleaning may go a long way.

I believe this has to be done by the original poster or the moderator.

Craig

I've had pretty good results with a Alpha Delta DX-SWL Sloper - 40ft version which you can get fron Universal for $69. Since I live in Texas and have a one story house, I connected one end near the roof drain about 14'high and the other end to the top of my 6' fence at the back of the yard running north to south. Since the antenna runs parallel with my fence it never gets in the way. Even though it's below the recommended 20'-25'height at the high end it still works quite well with very low noise but maybe that's because it's grounded. I've tried several indoor and ourdoor antennas both passive and active but this one has given me the best reception.

I have one too and have also had good results. It is a multi-band antenna, and has a low angle of reception for good DX. I hauled the feed end about 20 feet up into a pine tree, and attached the other end to another tree with a weight and pulley arrangement so it will stay tight without breaking when the trees sway. I chose the pine tree because it doesn't have much in the way of limbs up there - you could also attach it to a chimney or the gable of your house - it two stories that gets you the ideal 25 foot height.

There is a longer one that goes down to 160m, but this one goes down only to 90m. That's an advantage if you want to attenuate local AM broadcasters, which this antenna definitely does. You would not want this antenna for MW DX.

George,

No, it's not horizontal. The feed end is 20+ feet high and the other end is a little less than 10 feet, consistent with the instructions. The exact angle is not supposed to be critical. Most antennas want to be horizontal and sloping is a compromise. The nice thing about this one is that it wants to be sloped, which makes installation easier.

OK, same experiment tonight, Radio Prague this time. Going to narrow AM definitely reduces fading distortion, as discussed below. But S-AM vs AM makes no difference to my ear, narrow bandwidth or otherwise, detuned/shifted or not. I'll stick with ECSS.

2820. Antenna 1 or 2?

Yahoo group: icomr75 (2000 — 2002)
Date: 2002-11-09 03:23:58 UTC
From: Lloyd
Topic: 2820 Message: 2820

I just recently moved and had to re-run my antenna wire. I have a long wire about 25ft run out the window of my bedroom and ran along across the lentgh of my back patio from the top of both sides.

My question is, Should I use the antenna 1 or 2 input? I'm currently using the number 2 - the one with red prong on the back.

On another note, I noticed at the new apartment, that there is not as much RFI and EMI noise on the bands. This is very good!

hi Larry:

i agree: to reduce fading ECSS works best. i can tell the difference between SAM and AM because i did that mod (and 4 others). Passport was fair: ECSS was so good it carried the unit; however, it's just a few mods away from great AM as well.

phil :)

Dear Phil,

thank for your many good suggestions...

Well, I have a Palstar with 6KHz Collins mechanical filter,
and that filter spoiled me.
With the Collins filter, if there is a STRONG station, it is
gone after you detune about 4KHz. This means, in particular,
that if a weak and a strong station are 10 KHz apart,
the strong station does not influence at all the weaker one.
The 6 KHz filter of the R75 is much wider, I still hear a station
very well after I detune 5KHz.
Now, of course I can use on the R75 a number of tricks to still
receive the station, but the question is: why do I have to do
that? Couldn't ICOM sell as an option a better 6 KHz filter?
The 3.3 KHz, for instance, is much better.

Peter

2823. Only gripe about R75

Yahoo group: icomr75 (2000 — 2002)
Date: 2002-11-09 06:58:14 UTC
From: ptrlmpn
Topic: 2823 Message: 2823

I have only one complaint about my R75; a problem for which I
have found no solution so far.

Sometimes there is a weak station wedged between very strong stations.
Using the excellent 2.3, 2.8, or 3.3 KHz filters, I usually can
cut out without too many problems the strong stations.
But the problem is that the AGC is sensitive to a wider amount of
spectrum than what goes through the filters (perhaps because the
AGC measures signal strength also before the last filter).
Hence, the AGC senses the very strong signals, and sets
amplification low.
The result is a high reading of the S-meter (sometimes S20 or so),
and a silent audio.

Let me repeat: the problem is NOT that I hear interference from
neighbouring stations; the problem is that the neighbouring stations
swamp the AGC even though they are filtered out eventually.

Has anyone else noticed this problem? It is not very common, in
all fairness, but you notice it once you know what to look for:
high S-meter reading, and no (or very very low) audio.

Best,

Peter

howdy Peter!

i can see why you like the collins filter. IMO ICOM should have done plenty of things differently. they could have used high quality ceramic filters. FM (c 15 kHz filter) ends up a liability.

phil :)

hi Peter:

interesting... does turning the AGC OFF and setting manually help? just so i am not making assumptions: are you using SSB? also have you done the AM AGC mod? according to the schematics the AGC is getting its level after all filter processing, just before the SSB BFO. please compare the volume on AM versus SSB and report (under the conditions you mentioned). try also without the pre-amps on or with the attenuator and note findings.

my ECSS 'volume' mod is a misnomer, it is actually a mixer gain mod... the mixer is the one at the SSB BFO mentioned above. what i believe could be effecting the AGC is an AM signal's strong carrier [~2/3 of power is here]. when receiving for example a ham on LSB all is well (by design) but using the radio to tune AM stations via ECSS... you sometimes get low volume. the problem is that raising the volume control is not always effective as i believe the signal sent to the pre-amp is too low. in the AM mode everything is loud because the Motorola chip is capable of up to 17 dB (my calulations) of its own gain! after my mod ECSS volume will more closely approximate that of AM volume. it is not without some minor drawbacks as discussed in my pdf. FWIW i rarely use ECSS now that i've done the AM mods... the way i set up my mod it can be negated by simply turning a variable trimmer resistor (a switch could also be used). my idea was to boost the signal beyond the 'reach' of the AGC [as with Motorola's chip] so even if it remains low the signal will be bumped up before the pre-amp.

phil :)

ICOM has a better 6 kHz filter for the 9MHz IF. I think it is called FL102. It is a direct drop in for the first IF. Nice choice if AM is what you prefer.

By the way: The 6 kHz filter in the R75 measures about 7,5 kHz at its 6 dB points.

Lloyd,

ANT1: it is for antennas with feeding of coaxial cable: RG58 /50 ohms

ANT2: it is for longwires with feeding of common cable /300 or more ohms.

Enrique

Phil,

Right.

I think the original question, in various flavors, was "How can ICOM pass a 'red face test' claiming the R75 has S-AM?" or "Under what conditions does an un-modified derive benefit from S-AM?" or "Do we just not know how to use S-AM because if it really doesn't work why doesn't ICOM spend 10 cents to fix it?" This last experiment confirms the hypothesis that the only thing that *consistently* and unarguably makes S-AM work is to modify the radio.

This appeared a while back in rec.radio.shortwave (and there is an 80-article thread on it).

payman

From: Ali N. (alins@...)
Subject: ICOM R75 Synchronous AM - Reply from Tech Support
Newsgroups: rec.radio.shortwave
Date: 2002-06-10 14:19:46 PST

... Just thought people might be interested on the 'official' answer from ICOM on the synchronous detector in the IC-R75.

I don't have an R-75 and my guess would be that fine tuning ECSS would still be possible on this receiver even without a working Synch detector ...

Here is essentially what I wrote to them:

"... Many reviews on the web (rec.radio.shortwave, ehamnet.net), including the one below by Radio Netherlands, claim that the synchronous AM mode on this receiver is effectively nonfunctional (lack of selectable sideband).

Is this true, and if so, is ICOM in the process of rectifying this? Is there a timeline for correcting this (if true)?"

Reply from ICOM Tech Support:

"The SD works the way such a system is supposed to work. It is true that some have critized this system however it is basically the same system used in many median priced radios on the market. there is no change planned at this time."

Topic: 2636 Message: 2835

hi Larry:

i will make no excuses for ICOM: they could fix this radio with minor changes. IMO ICOM wanted to say the unit has SAM as a feature... the radio is loaded with features and they must feel this is important to driving sales. in theory the R75 has SAM but in its stock form it has little or no effect... why? we can look to Dr. Rado's mods. the Motorola AM Stereo chip is stuck in the tuning mode [aka useful for finding a strong local AM stereo station, just like the Motorola Data Sheet ordered] with 'very fast' PLL locking... and hence no whine.

to work the way we expect SAM to work there must be three changes. first, the PLL locking must be slowed... this is accomplished by adding a capacitor which provides hysteresis (lag). second, we must prevent the loss of lock during deep fades... this is accomplished by adding a resistor as a bias (base level) [utilizing the chip's 3V reference pin]. third, we must reduce the chip's 'very fast' AGC to 'very slow' so that it does not negate the relatively slow receiver AGC... accomplished via adding external capacitance.

IMO the sad part is that designing an AM radio is easier than making a decent SSB radio. ICOM has already done the "hard part". the Motorola chip is a good one but the implementation was not (don't get me started on the 450/455 IF stuff). IMO the good part is we get a $1200 receiver for half price because ICOM left off a few dollars worth of components... only "good" if we can solder, hence the impetus for my soldering pdf.

i plan on calling Japan to try and speak to some engineers via voice or e-mail... we shall see. ICOM's future plans interest me: if i were Mr. Inoue i would upgrade the R75 because it is a winner. i have a feeling that they may already be working on an R76 to introduce once DSP prices drop.

phil :)

For a plain vanilla random wire, use the 500 ohm input, which I believe is the one you are suggesting. Glad to hear of your lower RF noise - I hope to achieve the same reduction some day!

Nice comparisons. However some receivers were tested with 0,5 kHz filters, others with 2,3 kHz. Selectivity for AM measurements was not mentioned. Rather hard to compare under these circumstances.

Just one thing is really clear: DX320 is not a good receiver

True; I think the reason that for example the Grundig was tested with a 2.3 kHz filter is because it does not have a 500 Hz filter.

2842. R75 with built-in preselector?

Yahoo group: icomr75 (2000 — 2002)

From: payman_a
Topic: 2842 Message: 2842

Does the R75 have a built-in preselector? I think I read something to this effect just recently (maybe Phil wrote about it).

If so, does this mean using an external preselector like the MFJ-956 is pretty much useless for most people?

Please note I am asking about "preselectors" and not antenna "tuners".

Thanks a lot!

payman

hi payman:

the CPU selects bandpass filters in the front end. there is a 2 MHz LPF, as well as 2-4, 4-8, 8-11, 11-15, 15-22, 22-30, 30-50, and 50-60 MHz BPFs. these follow a 1.6 MHz HPF that keeps out local BCB.

This type of preselection is very simple. Octave filters only reject signals that may cause second order intermodulation. A really good preselector with tuned circuits is much better.

Thanks to Gert and Phil.

What would be a commercial example of such a good preselector?
Seems to me that the BP filters in the Icom should do a decent
job, making any more improvements with an external unit only
marginal unless one lives in an interference-heavy area.

Phil,

Being new to this group I wonder if you would answer a few of my questions?

I have listened to the debate on S-AM and whether ICOM really has a design or not. Not the purpose of my questions.

I have had my R75 about four months now and will the first to agree that the function leaves a bit to desired (understatement?). I have read (and re-read) your mods in this area (and the caveats) as well as Dr. Rado's Version 1.1 of the mods (and those caveats).

Now I don't mean to be presumptuous, but who is Dr Rado (I assume an Electrical Engineer) and what is his connection to this group?

Getting back to the mods, with the caveats (limitations?) you mention, explain why I would/should perform these mods. Again, I don't want to be presumptuous, do the improvements to S-AM really outweigh the limitations of the mods? What is the answer to the previous when one considers the availability of the ECSS option? My radio is in warranty yet and I will not make up my mind until the warranty expires.

Being an engineer (and Program Manager) myself, during my active career I steadfastly refused to answer "the whys" of a particular design as I found that most were self serving. Design suggestions were always given careful consideration, and some were implemented, although most were refused for a multitude of reasons (cost/schedule the most prevalent).

Let me close by apologizing to all as it is not my intent to stifle (regardless of the past email) a discussion.

Thanks.

John P.

2848. Re: The unasked S-AM question

Yahoo group: icomr75 (2000 — 2002)
Date: 2002-11-10 23:22:26 UTC
From: ptrlmpn
Topic: 2844 Message: 2848

I think this is easy to answer.
First, if you look back, I posted a message "In praise of the R75 AM detector", where I explain that the normal AM mode is already a quasi-synchronous detector (it works much better than normal envelope detectors, btw, for fading signals). Hence, the lack of difference between AM and S-AM is due to the fact that:

1) AM is already quasi-synchronous
2) S-AM is not perfectly implemented.

Now thinks what happens when you sue them.
They say: hey, look at the schematics, we _are_ doing synchronous detection (and any expert called to testify would have to agree with that).
Then you say: but I think it doesn't work.
They reply: hey, compare it with the envelope detector of another radio. Hear the difference? Isn't it better when there is fading?
And again, the expert would have to agree.
Your last shot at it: but, there is no difference between AM and S-AM!
They reply: ah, but this is because our AM mode already incorporates quasi-synchronous intelligent blah, together with enhanced yakyak, so that... and, how are you going to argue about that? Or are you going to sue them because AM is not envelope detection? But they never stipulated that!

So I think it is better to save litigation lust for other purposes.

The bottom line, in my opinion, is the following:

A) The S-AM button is useless, fixed or not (I have had mine fixed). There is never a situation when it clearly works better than AM.

B) By comparision with other radios, I _know_ that the AM detector is much better than traditional envelope detectors; after studying the schematics, I can in fact see that it is NOT an envelope detector. To understand exactly what it does I would need to know more about a proprietary Motorola chip, but I know that in practice, it works very well.

C) Most people expect that when they push the "synchronous" button, they hear a difference. When they don't, they complain that the feature is not there. Somebody put it in an excellent way in rec.radio.shortwave: I am quoting from memory:
<<
Most people don't really judge, or buy, a radio, based on true performance, but based on an expectation of performance.
They aren't really able to judge how good the AM or S-AM mode of

a radio is, and they mostly don't run scientifical comparisons between
the ultimate listening qualities. It is not on performance that they
judge, but on "expected operation": the number of available features
(buttons), and how well the result of a button press match the
expectations.
>>

To clarify, assume that Icom designed a radio in which, due to the
features of the first few IF stages, noise blanking was already
performed 99% there. But assume that they also added a NB button,
that only had a marginal effect (due to the negligible residual amount
of impulse noise to take care of).
Then everybody on these newsgroups (and r.r.shortwave) would be jumpin
up and down screaming that "NB doesn't work". Very few would actually
measure the performance of the R75 in presence of impulse noise, and
compare it with that of other radios.

In fact, has anyone noticed that among published measured performance
parameters, there is nothing related to the performance under fading?
I bet almost nobody (save perhaps Icom itself, and Motorola while
designing the chip) has ever measured quantitatively the performance
under fading, which is the whole point of synchronous detection.

Peter

hi Peter:

> A) The S-AM button is useless, fixed or not

first make sure in SETUP that 'SAM SW' is set to 'En' then try this...

1) tune to a station using SAM ex. 600 kHz.
2) reduce the RF gain significantly
3) retune 500 Hz away ex. 600.500 kHz
4) switch to AM mode and the sound will be fine
5) switch to SAM mode and you will hear a 500 Hz heterodyne
6) increase the RF gain... as soon as the carrier is strong enough
for the Motorola chip it will lock onto the carrier. this illustrates
that synchronization is occurring under SAM. however, the best way to
prevent fading is still by carrier replacement (re-insertion)... SSB
(BFO).

hi John:

> Dr Rado (I assume an Electrical Engineer)
> and what is his connection to this group?

Radostin Danev created the Sync-AM and AM-AGC mods... he also started this Yahoo eGroup. he became a doctor somewhere between post #1 and now... i am unsure if his doctorate is in EE (mine is not).

> explain why I would/should perform these mods.

the PDFs (or text files) explain how the mods enhance performance but ultimately only you can decide whether you will want to perform them.

> do the improvements to S-AM really outweigh the
> limitations of the mods?

what are the limitations you refer to with respect to the SAM mod? i ask because IMO (S)AM was pretty lousy before Dr. Rado's mods. i now rarely use ECSS for reception of amplitude modulated signals.

> What is the answer to the previous when one
> considers the availability of the ECSS option?

IMO you can hear everything using just ECSS... the stock radio received a good rating in Passport especially for ham, utility, and DXing; however...

want better (S)AM sound quality? consider Dr. Rado's Sync-AM and AM-AGC mods. want better fidelity? consider my fidelity mod. want better sensitivity for the BCB? consider Pete's MW attenuator bypass mod. want to add an inexpensive ceramic filter? consider looking at my filter mod for ideas. troubled by low volume on faint ECSS-tuned stations? consider my ECSS volume mod.

my goal, and i believe the goal of the others, was only to document mods we've performed on our own radios which we found useful. Ken tested all of my mods (doing them before me) and we both have many of the other mods on our radios as well. posting my mods took time and effort... however, i was greatful that Dr. Rado, Pete, and others documented their mods... so i decided to do the same with mine.

Hi Phil and John,

Here I am. Please, stop with that Dr. thing - I hate it. I think I already asked you Phil to stop Dr.-ing me.

For those interested. My master is solid state physics, my doctorate was on electron microscopy. Electronics is my hobby. My knowledge in electronics is not much more than the knowledge of most of the people here. I was just enthusiastic enough to do the research and brave enough to perform the first mods on R75. Actually modding is as much fun for me (if not more) as listening. Others (like Phil) have joined the modding group and this makes me very happy. It's just a radio. Most of my radios (not many) are actually modified :-). Like Yupiteru MVT-9000 (10.8 MHz images cured, this was real surgery, multilayer SMD boards), Sony ICF-SW07 (synch and AGC mod - now it is a very pleasant radio to listen to, tell me about modding SMD - this one is the real brave heart/cool hand test).
Actually my experience shows that the AGC action determines to huge extent how pleasant a radio is to listen to. I cannot understand how people may rate the Sony ICF-SW07 as pleasantly sounding (even on headphones). Before I fixed the AGC it was terrible.
My theory about the AR7030 famous audio is that this is in part due to the hang-type AGC used. My R75 now has such AGC (this is an unpublished mod) and is much better (in my opinion) than the V2.0 modded one. I am no thinking about publishing this mod though. Providing info about mods has some responsibility attached to it. No matter how huge is the disclaimer - I will feel guilty if somebody screws up his radio while performing my mod.
Anyway, I got carried away ...
Starting a group like this is not an easy task. In the beginning one has to "entertain" the few subscribers to keep them on the list. After going over the "critical mass" however it is self sustaining and is not so demanding on the creator. :-))
I am happy that it turned to be such helpful and "grown up" community. Almost nothing to moderate. This only problem I see now is the free space in the Files section. I will remove some files from the first versions of the mods. Like "R75_left SW07_right.mp3 " - a sound file I posted to convince people that that S-AM is working after the mod. It was not easy :-))).
Finally - I am quite busy. I am sorry I cannot contribute much to the discussions lately, but Phil and several other members seem to be doing a great job. Thank you!

Best regards,

Rado

P.S. Excuse any typos - my Windows installation is quite fresh ... have to install MS Office to get the spelling working ... and Dr. Phil, one more

time - I am just Rado :-))

Hi Phil,

oh, I know that the S-AM setting _does something_
(once fixed, that is).

I am just saying that it is _useless_.
I have never encountered a situation where I can hear a
station better with S-AM than AM or EECS.
Yes, I know, you can use S-AM to do single sideband, by
detuning with PBT... but in practice, why bother - EECS
is just as good if not better.

But this was my point. Even though S-AM to me is useless,
I should not compare the R75 to other radios based on
expected operation (if I push S-AM, it must sound different),
but on performance (how well can I hear if there is fading),
and on this the R75 seems to be very good.

2854. Report on 3khz Filter mod and Fidelity mod

Yahoo group: icomr75 (2000 — 2002)
Date: 2002-11-11 14:35:17 UTC
From: curtis_cr
Topic: 2854 Message: 2854

I finally got around to doing the latest two popular mods from Phil this weekend. I thought I'd share my impressions of the installation and operation with the group. I have previously done Rado's AGC and ver 2.1 SAM mods and loved the improvement. These two latest mods are magnificently documented by Phil in his folder under the Files section.

First, the filter. Installation is easy as expected with no hard soldering and no soldering in the radio at all. I tried some resistor leads in the connector holes in the radio, but they appeared to be either too large or too small. I then found out that the large opening at the surface of the mounting holes narrows to a much smaller opening further down. The leads from an old 1 watt resistor exactly fit when pushed with a small force down into the hole and make great connections that way. This is a nice new filter to have and gives a nice additional selection on AM. You can't select it in SAM, so there's no way to try it there. Phil doesn't recommend it for SSB use, but I tried it and it seems to me to work pretty well with some fine tuning to find a spot without flutter. A nice add-on for only $10 or so.

Next the Fidelity mod. I LOVE this one. I had always been a bit dissapointed with the raw audio quality of the R75 - it always sounded like it didn't have enough high frequencies. I use a set of OK 2-way computer speakers and got great audio from a WJ8716 but relatively dull sound from the R75 with the same speakers - both connected with a stereo plug to the earphone jacks (though I tried the other outs and they sound the same). This mod makes a world of difference. Now you can hear the esses in speach and it sounds much more natural and pleasant. A major improvement IMHO. The installation requires some tricky soldering though. I'm only so-so with a soldering iron, and even with my magnifying hat it wasn't a walk in the park. Still, with careful pre-tinning of the wire ends and with premounting of the resistors so you don't have to stress the wires after they "stick", things worked out all right. I did discover that the upper right and left edges of the resistors are metal and a good connection point, so you don't have to try to find the microscopic leads as they touch the circuit board. I think if the engineers make these things much smaller, mods will be a thing of the past.

Anyway, with 4 mods done on the radio, it now works and sounds better than the stock radio - which I liked a lot, BTW. Thanks again to Phil for going to all the trouble to publish these last two.

Hi Phil and Rado,

First, thanks for the rapid responses to my questions. Second, let me apologize again if I sounded a bit presumptuous or officious but I was just trying to gather some answers. I guess my years of experiences with "user communities" and "got to have mods" was showing in my reluctance to accept, on face value, the mods as offered.

Rado, I played the audio file that you suggested and it made a believer out of me. And Phil, your comment on not using ECSS, and the necessary fine adjustment, after the mods cemented my decision to go ahead with the mods. Finally Rado, do you have a layout of the board that you used for your Version 1.1 of the mod and does it incorporate the components of Version 1? I don't want to re-invent the wheel.

In the mean time I have a question about ICOM and their service policy. Do either of you know if ICOM will perform repairs on a modified R75 should a future, out of warranty, failure require them?

Thanks to you both for the help.

John

Excellent proven models are:

MFJ-956 (passive ATU only) and the preselectors 1040B, 1045C, 959B
All work well in my rxs.

2860. Frankenstein junior II [4 mods]

Yahoo group: icomr75 (2000 — 2002)
Date: 2002-11-12 00:57:10 UTC
From: atagrasin
Topic: 2854 Message: 2860

HI Curtis welcome to the R-75 frankenstein world.Your receiver is frankenstein junior II.The frankenstein series include the R-75 with 4 or more mods [I did 6].Do you did the sensitivity mod for MW?

> I finally got around to doing the latest two popular mods from Phil
> this weekend. I thought I'd share my impressions of the installation
> and operation with the group. I have previously done Rado's AGC and

Yes I have this one too.A very easy mod and cheapy mod.

> Next the Fidelity mod. I LOVE this one. I had always been a bit

This mod makes a world of

> difference. Now you can hear the esses in speach and it sounds much
> more natural and pleasant. A major improvement IMHO. The
> installation requires some tricky soldering though.

With the using of the micro wires and a good magnifier not a difficult mod.You only need 6 pieces of wires.

> wires after they "stick", things worked out all right. I did
> discover that the upper right and left edges of the resistors are

hi Rado (see, i am learning):

i am the same and enjoy modding as much as listening... i mod non-electronic products as well. i had planned on variable-AGC, variable-NB, and PBT mods as well; however, i am pleased with my radio as-is now. i tried to make the mods simple as i would also feel bad if someone ruined their radio performing them... was impetus for the soldering PDF. i appreciate freeing up some file space... we could always put the mp3s on a free server.

phil :)

2864. Re: The unasked S-AM question

hi Peter:

i see your point. i find during MW DXing (c modified unit) that SAM sounds much richer even while detuned; however, i switch to ECSS for strong adjacent interference (tuning near local blowtorches) or severe fading (rare). i very much appreciate your comparisons to other radios.

phil :)

2865. Transceive Mode Help?

Yahoo group: icomr75 (2000 — 2002)
Date: 2002-11-12 01:37:35 UTC
From: k0adl
Topic: 2865 Message: 2865

Has anyone out there ever used the R-75 in "Transceive" mode?
Transceive mode is when you have an R-75 connected directly to an
Icom transceiver (in my case, an IC-718). There is NO CI-V device
used when this done - the radios are simply connected from one
remote jack to the other. The R-75 has a "Mute Control Jack" but
the manual doesn't really say how to use it for transceive
function. Has anyone done this (transmit with an Icom rig, but
receive with the R-75)? If so, how do you use the mute control
jack, and do I HAVE to have a CI-V box to do this?

Thanks,
Alan

hi John:

no need for apology. ascertaining how the mods perform before taking a soldering iron to your radio makes good sense to me. i aimed for safe mods: soldering large resistors in parallel to existing resistors using the procedure described in the soldering PDF. low risk even if accidentally soldered to the wrong place: ex. 47k-ohms at 19V (+14V to -5V) max potential means at most 0.4 mA current. the mods are also non-permenant and can be removed by simply clipping the wires.

ECSS is extremely good on the R75; however, i do not use it that often anymore for amplitude modulated signals. i do NOT recommend my ECSS volume mod unless you are bothered by low ECSS volume (less useful after fixing the AM section). i do NOT recommend my filter mod especially either; however, the mod documents inexpensive filter addition and the 15-pole ceramic murata has good specs and sound.

IMO the essential mods to fix the (S)AM section (in the order i would do them) are: AM-AGC, Sync-AM, and fidelity.

i know of no PCB layout. most people get some perf board and use wire-wrap (soldered)... you may want to check the pics in the 'Photos' section.

check previous message posts: if memory serves me ICOM will still do repairs. maybe some type of "burn-in" test would be useful... afterwhich i believe component failure rate would be very low. IMO ICOM has excellent quality control.

> Thanks to you both for the help.

you're very welcome.

phil :)

2867. Re: Report on 3khz Filter mod and Fidelity mod

howdy Curtis!

> I finally got around to doing the latest two
> popular mods from Phil this weekend.

hehe, i like your use of the word popular but i suspect you are only the third to do them! :D

> the large opening at the surface of the mounting
> holes narrows to a much smaller opening further down.

good point... i should have mentioned in the PDF. i originally shoved a large piece of wire into the holes... only to find that while using the filter it cut-out... i had no idea the smaller diameter hole was further down. Ken brought this to my attention as well as the wiring layout (argh!). quite amusing... i wrote up the mod and then had to e-mail Ken several times to ask how to perform it lol. Ken has no fear and is lightning fast with a soldering iron... without his help there would be no mods.

i noticed the same on SSB! flutter unless centered... the other side must be entering the passband.

> Next the Fidelity mod. I LOVE this one.

:D i am very pleased to read this post. the radio sounds very different now to me. the big surprise is that the DSP functions to 5 kHz... way to go ICOM!

> A major improvement IMHO.

thank you. have you tried using 15/15 kHz filters on a "clear" channel? the fidelity is incredible. FWIW you should avoid using the 15/15 filters with the DSP (NR or ANF) because of possible aliasing sound distortions (although i have not been able to elicit these as the DSP possibly has filtration of its own). if SSB sounds odd (too much highs) simply twist the PBTs in opposite directions slightly... the IF filters will easily cut down the fidelity (reducing RF gain can also alter what is passed).

IMO an ideal setup would be to use the 'REC' out (aka bypass the higher distortion components) and pump audio into a low-distortion amplifier with tone controls (this coming from someone who is using $20 walmart computer speakers lol).

i hope some of the gurus (Rado, Pete, and others) will try my mod... between the choices of 47k-ohm or 100k-ohm [and switch option, which IMO is unneccesary] i feel they will be pleased with the results.

> Still, with careful pre-tinning of the wire ends

this is essential.

> and with premounting of the resistors

again essential... i should have mentioned this also.

> BTW. Thanks again to Phil

you are VERY welcome. another Frankenstein is born!

Phil,

Thanks for the info. In your list of recommendations you neglected to mention Rado's Version 2 (I.E. lock detector)? Have you done the mod and, if so, does it reduce the objectionable whines?

As to "Burn Ins", I have plenty of experience in this area. With "Unqualed" components that have not been "Screened" you can expect most infant mortality failures within 700 hours of operation. As I got my radio in mid July I should be close by the end of the year.

My plan, as of this writing, is to fabricate both Mods (Versions 1.1 and 2) on to a small circuit card and use ribbon cable to make the radio connections. If I can find an appropriate connector I will use it as a disconnect (with a jumper plug to return to unmodified condition). This should make a neater installation and should salve ICOM (if necessary).

When it's done to my satisfaction I'll post some photos.

Thanks again.

John P.

2869. Re: What's an IF?....

Yahoo group: icomr75 (2000 — 2002)
Date: 2002-11-12 03:12:21 UTC
From: LarryR
Topic: 2856 Message: 2869

Good links. If you want the high-level Reader Digest version:

All modern radios us an IF (intermediate frequency) to provide most of the signal amplification. This means that all input frequencies are converted to a fixed frequency. The reason for this is that it is easier to build an amplifier that works well on a single frequency than lots of different frequencies. It's also easier to make filters that select the frequency bandwidth you want to hear if they are a fixed frequency. This process I just described is called superheterodyning. It works well for a single stage for a single band receiver (like an AM radio). It doesn't work well for a wideband radio like the r75. The reason is that heterodyning creates images, which means the same signal will be heard at multiple tuning dial positions (the links Craig provided explain all this). Doing the IF conversion twice (called dual-conversion) reduces the images. Triple conversion is even better - the r75 actually has a 60MhZ first IF, but you don't hear about it because you can't select filters for it, so the r75 is actually a triple conversion receiver.

hi John:

> you neglected to mention Rado's Version 2

you are *absolutely* correct. i actually installed version 2.0 (one with transistors). with version 2.0 switching 'SAM SW' in setup from 'En' to 'SA' will allow simulation of mod version 1.1.

> does it reduce the objectionable whines?

version 2.0 locks quickly (minimal whine) and stays locked.

> failures within 700 hours of operation.

i had no idea!

> My plan, as of this writing, is to fabricate both Mods

all you need is verion 2.0 or 2.1 (one with quad op-amp)... i have no idea which is better as i've only done version 2.0.

> When it's done to my satisfaction I'll post some photos.

please do!

Here I have to differ. With my "fixed" S-AM, it is noticeably better than AM, and drastically better than my non-S-AM DX-398. Then after a few snips...

Is S-AM supposed to *eliminate* fading, or actually compensate for the
distortion that occurs when the fading takes place? I still see some
signal degeneration on my S-meter and to my ears when a fade occurs, but
more importantly, the sound remains clear and ungarbled. I can live with
signal diminution if I can understand what the broadcaster is saying...

Yes, Peter Maus is a very perceptive and worthy fellow! His input is
always valuable.

Hi Phil,

Thanks for the kind note. I have used this with the AM wide setting of 15/15 and you're right - it now sounds really nice. On these stronger stations I can also turn off the dsp and get even more natural highs.

I'm surprised to hear that the fidelity mod hasn't been super popular - I suspect that it's due to the stomach churning caused by the first look at those micro-resistors. But if I can do it, it's not that hard.

As to the Frankenstein designation - I'll take it with pride, but there is still lots of open space in the radio!

Hi and thanks! Glad to be in the exclusive club of Frankenradios. I didn't do the MW mod since my homemade MW loop picks up all kinds of electrical noise on weak stations and I haven't tried to see if I could figure a way to make it better with the R75. The same loop works great inductively with my portable SW radio and I use that mostly for MW.

Bruce,

You are hearing what SAM should do. I.e., clear up the distortion
during selective fading. The S-meter will still indicate a fade and
you will hear amplitude changes, but the majority of the distortion
should go away.

Craig

2880. Going beyond Kiwa mods

Yahoo group: icomr75 (2000 — 2002)
Date: 2002-11-13 02:16:45 UTC
From: payman_a
Topic: 2880 Message: 2880

The discussion about mods has been very fascinating, but I am still left with one question: let's say you have an R75 (like me!) which has ALL the Kiwa mods (i.e., 450 kHz Filter Upgrade, Synchronous Detector Upgrade, and Audio Upgrade). Should I still do any of the mods described by our experts in this forum? Can I?

Thanks a lot!!

payman

John,

Do you have a circuit board layout for your 2.1 circuit?

It appears using the transistors in the 2.0 mod would be easier to build. A circuit board layout for use with the IC.

Thank you,

Rodger

> I designed the v2.1 S-AM circuit, not Rado.

thank you for bringing this to our attention. if you have time can
you give us a brief explaination of how your mod works and how it
differs from Rado's ver 2.0. also if anyone has done both please
share your thoughts.

thanks,
phil :)

2883. Re: Going beyond Kiwa mods

Yahoo group: icomr75 (2000 — 2002)
Date: 2002-11-13 06:28:10 UTC
From: just_rtfm
Topic: 2880 Message: 2883

hi payman:

i am no radio expert but AFA my mods go: the filter mod was done for the purpose of documenting the mechanics of adding an inexpensive ceramic filter for AM usage... you already have enough filters so i do not recommend it. my ECSS volume mod was done when i was using ECSS exclusively and troubled by faint ECSS volume... you have Rado's mods so i do not recommend it either.

the fidelity mod is different... it enhances Rado's or John's mods and changes the radio's sound significantly. i documented it early because quite frankly i was afraid of starting another project and not getting around to it. my hope is to do a spectral test to more scientifically compare the 47k and 100k-ohm resistor choices but this may not happen anytime soon. IMO any surface-mount mod will take considerable (but learnable) soldering skill.

phil :)

2884. Re: Report on 3khz Filter mod and Fidelity mod

Yahoo group: icomr75 (2000 — 2002)
Date: 2002-11-13 07:02:56 UTC
From: just_rtfm
Topic: 2854 Message: 2884

hello Curtis!

FWIW i avoid using the 15/15 filters with the DSP ON (NR or ANF) because the DSP will not pass audio above 5 kHz. the 15/15 filters allow 7.5 kHz of audio... so everything from 5.0 to 7.5 kHz in frequency response will be 100% attenuated by the DSP... and these frequencies may cause distortion. although i could not elicit any distortion (possibly due to filters on the DSP itself) it's best to avoid the possibility by switching down to 15/6 or narrower (aka use anything but 15/15) when using the DSP. YMMV.

> I'm surprised to hear that the fidelity mod
> hasn't been super popular

thanks! it is a very new mod... AFAIK you are only the third person who has performed it. you are a pioneer. i suspect others will follow. please feel free to openly give any feedback on the mod... good or bad... so that others can make an informed decision. i feel that between the 47k-ohm, 100k-ohm, or switch options that everyone can be accomodated.

i would like to do a spectral comparison of the 47k-ohm versus 100k-ohm resistors but this will not be an easy task. in theory i would have liked to have set the resistors to a value between 47k-ohm and 100k-ohm but these are the standard resistor values. Ken liked the 47k-ohms better but i still remain curious and would like to quantitate the differences. i'd do the testing but at the moment i am so happy with the audio i just don't feel like fooling with it.

> As to the Frankenstein designation - I'll take it with pride,
> but there is still lots of open space in the radio!

lol. don't encourage us!

regards,
phil :)

HI Payman:Yes I recomend the sensitivity mod MW [from Pete
Gianakopoulos]after this mod the R75 as having an MDS of .07 to .1uV
across their ranges.Check files in this group.The best all around mod
is the Phil's fidelity mod that increase the high freq range spectrum
of the audio and DSP.
Atagrasin.

2886. Re: Going beyond Kiwa mods

Thanks Phil and Atagrasin. Looks like the sensitivity mod may be worth trying, as well as Phil's fidelity mod. I have the Kiwa 'audio upgrade' ("Key components to the audio power amplifier are replaced to enhance clarity and definition.") and my R75 sounds very good with an external speaker. All I am concerned with is in replacing a Kiwa-inserted/changed device (resistor, ...) which may mess up the 'audio upgrade'. But if Phil's fidelity mod does not involves such a component, and deals with "original" R75 components, then I suppose I can try it.

Warning on the MW sensitivity mod: I live in a heavy MW RF signal area, and those signals are a major pain in the derriere on the lower HF frequencies. For a number of reasons I not think the radio itself is the culprit; but I would assume that, if the MW attenuation were to be implemented, it would not help the HF problems, and external attenuation would become totally necessary. Around a major urban area, I would not do it.

OTOH, in the rural areas away from major transmitters, I cannot see any reason not to do it. One would need to determine one's own sensitivity to this problem.

I, too, am concerned about this.

I was an electrical engineering major in college some decades ago, but switched to math major. Though at one time I had significant soldering experience with ICs and circuit board components, I really haven't held a soldering iron in 20+ years.

I imagine I could do many of the mods here with no trouble...but there's no guarantee. I wonder if the "gamble" of doing it yourself is worth the money you save. Perhaps the limited return on this gamble would indicate it be best for us to play it safe and use the Kiwa pros on this one.

Still, I think I may try it myself. There are some nice "soldering practice" tips in Files section here...

What do you all think?

Carl

Is there a R-75 button to go back to "previous channel" as in TV remotes?

It seems such a feature would be quite useful in SWL, as many of or frequency entries often turn out dead.

Does the Sat 800 have such a feature?

Carl

Carl,

I use "MEMO" location 1 for this purpose (as a scratch pad). Just dial it up before you start and then hit "M/W" (even if your unsure you want to return) and viola it's there.

HI Bill: go for the AGC mod.A very easy mod.Take one 220uf
electrolitic capacitor and install the + in pin 4 and - to ground of
the MC1022 sync det IC.Check "files" in this group.You can use a thin
wire between the Cap and the IC.

From: just_rtfm
Topic: 2888 Message: 2898

hi Bill and Carl:

do not gamble with your precious R75. please read the soldering course in the files section... then get an old surface-mount PCB (ex. cell-phone) and practice. when you can consistently solder a piece of wire-wrap to a resistor or chip leg in a few seconds THEN think about doing the mods.

IMO the mods should be done in this order: AM-AGC, Sync-AM, and last fidelity. i added the fidelity mod in ~2 minutes. this mod can be reversed in 15 seconds... but i am certain you will find it a keeper. maybe Kiwa will offer the mod to their customers.

phil :)

Thanks Phil,
I have been looking at soldering stations all night. I have several ancient pieces of soldering equipment but the minimum wattage is around 20W uncontrolled but I can't be sure because the data have rubbed off and I can't find the instructions <sigh>. I am about to get out the ammeter and measure their consumption. Then there is the question of replacement tips, which is which.

Right now I am wondering what "ESD Safe" means. There are several temp controlled irons (stations) out there in the $90-$100 range, some ESD Safe. I guess the SD in ESD stands for surface device... Then there are analog and digital types. I retired long before surface mounted devices arrived in any quantity so I have almost zero experience with them.

Years ago I was NASA certified to solder, you know, if you can see any solder on the finished joint you flunk. But things have changed and I'm not sure these old hands and eyes are in sync any longer. But I have a burning desire (pun intended) to do your fidelity mod.

I do know that temp is only one critical factor, magnetic flux can fry chips, especially CMOS. (They still make CMOS right?)

Anyway, I have the R-75 & M800 feeding a fairly high-fi audio system via a Berringer mixer. I can slide back and forth from one to the other. The R-75 sounds like it's in a barrel as compared to the M-800. The Berringer has 3 true tone controls (=- not lossy) and I can twiddle and get the R-75 almost there.

Sorry for the ramble, I guess I am frustrated, 5 or 6 Irons and I don't know the wattage of any.

BTW, Radio Shack has a sexy looking station with digital temp readout (350°-840°f) for $99. Tempting...

Can't tell from the photo, but the ground pair on the radio (inner or outer pair will register as a DC short (0 ohms). The same should be true on the filter.

Bill,

ESD stands for Electrostatic Discharge. Very bad for chips. I think they mean the iron is grounded (and so should be the device being soldered). Then again, it could be the opposite.

BTW, they still do CMOS. In fact, that's mostly all they do. The other stuff (NMOS, bipolar) isn't seen much anymore.

Larry

2905. Macintosh software to control R75

Yahoo group: icomr75 (2000 — 2002)
Date: 2002-11-15 03:44:15 UTC
From: vr500pjh
Topic: 2905 Message: 2905

Greetings,

I've been working on a software project to allow my Mac to control
my R75. Since this is not a trivial project I plan to distribute
it commercially. My intention was to reduce the tedium of entering
frequencies manually, and to make the R75 much more convenient to
use. For example I wanted to be able to see a spectrum showing
all the activity within a range of frequencies and to be able to
navigate back and forth from one peak to the next using mouse-clicks.
I also wanted to be able to load subsets of frequencies grouped
according to my interests (one file of ICAO frequencies, another
of broadcasts, another of maritime, another of wxfax etc.)

What would Mac users on this list consider to be
a reasonable price for such software?

Here is a list of its current capabilities:

Mode Control - select SSB/CW-RTTY/FM/AM

Signal control - ANF/NR/NB/ATT/AGC/ANT

Volume control

Squelch control

Passband 1 and Passband 2 control

Frequency list importing

Frequency list scanning - arbitrarily limited to 1000 freqs.

Frequency list exporting to the R75 (99 freqs. only)

Spectrum Display

- user specifies bandpass, number of samples, and
how many sweeps to make

Multiple sweeps allow for the spectra to be
averaged which increases the sensitivity.

- user can select between spectra such as
S-Levels

Differentials

Deconvolved S-Levels

Activity (Max minus Min s-level at each freq.)

- Clicking on the spectrum display sets the
R75 to the corresponding frequency

The software is nearly complete and I've decided to just finish
off the current version with only one or two additional features
and leave other major enhancements I have in mind to later upgrades.
This means I could release it by month's end - assuming I encounter
no major design problems.

So, what do the Mac users think would be a ballpark fair price for
this software?

Regards,

PH

howdy Bill:

> I have been looking at soldering stations all night.

some are expensive! my first Antex is 20+ years old... bought another just for the needle tip. they are efficient: 12 Watts but they achieve a tip temperature of 625 F. as Larry said: ESD refers to electro-static discharge... some use anti-static mats, wrist-straps, and grounded soldering tips.

> Years ago I was NASA certified to solder

i did some soldering at a defense contractor long ago. you'll pick it up again fast. i practiced by putting about 25 pieces of wire wrap onto an old cellular phone PCB... it gets to the point where it is no longer a challenge.

> (They still make CMOS right?)

oh yeah! low power is in! AFAIK CMOS is used for memory, CPUs, digital logic, ASIC...

> The R-75 sounds like it's in a barrel as compared to the M-800.

perfect description! before the mod my R75 sounded like it was on the other side of a wall. some feel that ICOM's audio is inherently horrible... not so! when i compared the R75 schematics to those of other receivers what i found is that the R75 is very well designed; however, it is geared toward SSB (ham) where those tight active filters make perfect sense. i am just thankful ICOM overdesigned the DSP! make sure to do the AM-AGC mod and then Rado's or John's mod or Kiwa mods first.

phil :)

2907. Re: $19 Filter Mod Error

Yahoo group: icomr75 (2000 — 2002)
Date: 2002-11-15 06:29:14 UTC
From: just_rtfm
Topic: 2899 Message: 2907

hi everyone:

i followed Criag's advice and got out my multimeter (letters refer to pictures in link below):

http://members.truepath.com/justrtfm/correct.gif

'A' shows the schematic in Files section Murata PDF... unfortunately the orientation tab is not shown. the net yielded only one document with the tab orientation for the CFS455 series filter... shown in 'B' (also in my PDF). notice the green circle around the orientation tab... AFAIK if this had been a dashed line then this would have been a view from the top of the filter (aka side where only metal is seen)... since it is solid we must be looking at the bottom (aka the side where the wires protrude). notice how the side with the orientation tab also contains the grounds (pins 2 & 4). i confirmed this with a multimeter (resistance tested): '2-4' revealed 0.3 ohms [aka both are grounds]... whereas '1-2', '1-3', '1-4', '2-3', and '3-4' revealed 1.5 Mega-ohms+.

'C' shows the filter socket schematic... notice '2' in purple. 'D' shows a stock ceramic filter... notice that the purple circle corresponds to an input (red circle). bottom line: the J88X designations do no correspond to these numbers. 'E' shows the 455 kHz optional filter socket as viewed from the front. multimeter testing for AC voltage (black lead grounded, radio running) revealed the following: red lead to J881 lead to 'higher' voltage: J881 is IF signal input to the filter. J882 and J883 lead to 'low' voltage: J882 and J883 are the grounds. J884 lead to an audio spike when touched: J884 is the filter output line.

assuming (i know, bad word) that murata's schematic is in fact shown from the pin side then the orientation in my PDF is incorrect... the input and output lines are switched. i have used the filter in this position for many months... i fixed it and noticed no difference. a possible explaination: murata states that the filter is a 15-element (odd-numbered) ceramic of ladder construction having the same input and output impedance. 'E' shows what a 5-element ladder filter looks like (as per Murata PDF)... notice the symmetry... a 15-element is similar. i e-mailed murata but their only response to all my questions was something to the effect of "we recommend connecting as show" (hey, at least they wrote me back).

unless someone can find any flaw in the above i will be making changes to my filter PDF (hopefully this weekend). i will briefly mention the murata schematic orientation and my findings for the J88X

pins. i again apologize for the inconvenience my error has caused. i wish to thank both Enrique and Craig.

regards,
phil :)

Thanks for the encouragement Phil,

I spent the rest of the day attempting to re-repair my ICF 2010. I discovered that in a previous attempt I had almost covered two surface mount resistors! I do need a better iron. I ordered the Antex 15W (they didn't stock the 12) from HCM.

I have discovered that turning off the DSP makes the radio sound much better. The Sync and AGC mods were done before I bought the radio.

BTW, does the R-75 have glass-epoxy boards? They claim "commercial quality".

Sounds interesting. How do you handle the mac interface to the Icom RS-232
computer port? What OS are you developing it for? OS9 or OSX?

The normal thing would be that in the Murata catalog the filter was seen
from below, with the pins toward the face. But there is not relationship
with the check with a multimeter and in any place it is indicated which is I
and O.

> J884 is the filter output line.

This is also determined, because in the diagram MAIN UNIT(2) it is seen that
the resister R884 belongs together with J884 following the logic of 884 and
with R881 idem for J881.

2913. question about audio conrol

Yahoo group: icomr75 (2000 — 2002)
Date: 2002-11-15 20:16:22 UTC
From: usnoc
Topic: 2913 Message: 2913

hi,

i received my R75 yesturday and noticed that the audio knob does not increase volume gradually at the very beginning of the volume range.

in other words, turning the volume up from its zero position does not seem to have much effect until after it is turned by a few degrees at which point the volume increases "discretely". after that there is no problem.

has anyone seen it? is it by design?

thanks
konst

I think this is common. Mine does it too. To achieve smooth volume
control within that very low range, the RF gain needs to be used. Goofy.

Yeah, mine is that way also. I just run the audio through a set of computer speakers. I leave the R75 knob in a fixed position and adjust volume on the externals.

I'm using the Icom level converter which has a db25
connector. I have been able to talk to the converter by either
going directly from the modem port (round connector) on a G3
or using a keyspan Serial-USB converter into a USB pci
card I added to the G3.

Since it runs fine using USB-Serial converters on OS9 I don't
anticipate any (ahem!) problems with OS X.

2918. optional carry strap MB-23

Yahoo group: icomr75 (2000 — 2002)
Date: 2002-11-16 00:37:57 UTC
From: Albert Menzl
Topic: 2918 Message: 2918

I got my new R75 the other day. The optional carry strap is mounted with a pair of screws into unthreaded holes in the side of the case (kind of lame). The idea is that the screws will set their own threads when screwed in. The set of screws that came with my strap where the wrong kind and I managed to strip one of the holes out. Luckily I live in Seattle, so I drove over to the support facility in Bellevue and they fixed it by replacing the radios case. Seems my attempt to set the screw made the hole too large.

If you order this option make sure that the screws you get have a slight taper at the very end (mine didn't) so that they can start into the hole and set there own threads.

From: Jim
Topic: 2919 Message: 2919

I have had my R-75 a few weeks now and have gotten accustomed to using it. I have not done any mods to it yet and I don't know that I will in the future. I have been using my JPS NIR-10 DSP unit with it and I think it is probably more effective and definitely more versatile than the UT-106. I also have used a Yaesu FRT-7700 antenna tuner with it for awhile but found it to be of little value in most of the tuning ranges I listen to (nothing below 3Mhz). I am using a long wire (120' @30 ft). I like the radio very much and have been using some of the cookbook tricks to enhance reception. I am a licensed ham (K0JAD) but I am in a listening mode only these days. I owned a Icom R71A and enjoyed it but I think this receiver is more sensitive. In short, I am a happy camper.

My experience was almost as bad - the screws I got worked -- but not very well -- it would be VERY easy to strip the threads on the case with the supplied screws -- If you add this option, just be very careful when you screw in the fasteners. Also -- it is a poor design in that you have to remove the strap just to get at the case fasteners to remove the top half of the case. Doing this much will surely make the strap fasteners loosen, given the already poor ability to get them tight. I pretty much bought the strap because it was the last Icom accessory to get - so mine was never meant to be functional. . . . its a good thing.

Also -- it is a poor design in that you have to remove the strap just to get at the case fasteners to remove the top half of the case. Doing this much will surely make the strap fasteners<snip>

I got the optional voice synthesizer and the carry strap in the mail and proceeded to install both of them. The voice board was easy enough to install. I am underwhelmed by its performance though. It works but the audio level is quite low and is dependent on af gain so the voice annoucement is pretty well buried in the received signal. I like gadgets so I just HAD to have it. Oh well, it isn't the first thing I ever bought that was unimpressive.

NOW, the carry strap. The screws with it work-sorta. I got them into the holes but they won't tighten up. So the chrome end covers for the strap wobble around when you grab the strap. The teeny little screws for the rubber feet on the other side of the case go in maybe 1/8 inch. I was scared to tighten these very much. I'll probably take the strap and feet off , box them up and toss them in a drawer.. I certainly wouldn't trust the strap to carry $500+ worth of radio.

2922. R75 NOISE SUBJECT - CHAT

Yahoo group: icomr75 (2000 — 2002)
Date: 2002-11-16 13:28:53 UTC
From: The Internet Repair Shop
Topic: 2922 Message: 2922

So much information on the Mods of the R75, I just wanted to comment that the Noise Blanker is the best I've ever seen on a receiver, no damage is done to the Audio Component.

Now tell me this all you Hacking Guru's, The ANF seems like it should be called Automatic Interferance Filter for Heterodynes, But exactly, what is the NR supposed to do and what should the LEVEL be set at??

I don't see any differance only it chops the Audio down........

Here's another area for a MOD maybe......

Andy's ELectronics

Topic: 2918 Message: 2923

A tip on the voice synthesizer that I use:

When stamping a recording with the voice synthesizer, I turn the squelch to maximum momentarily. This will cut the sound of the signal you are listening to and won't affect the speech volume.

Hi Guys,
Makes one wonder if the DSP is worth anything. I like my R-75 a lot better
with it turned off. Is DSP just another fad like AM Stereo that'll fade into
the sunset?

Famous WWII radio signal: "Where is Halsey? The world wonders"

--Wm. "Bill" Brady, Harwood MD 38°51'30"N 76°41'00"W - Its in the darkest
hour that the most stars come out.

hi Andy and Bill:

> the Noise Blanker is the best I've ever seen on a receiver

yes, the R75 has a good NB.

> I don't see any differance only it chops the Audio down

little rant... IMO an ANF is better than fooling with manual ones and NR can save your ears! ICOM has this nice feature because it already spent the R&D money making the unit for its ham line!

yes, stock, the DSP (3-4 optimal setting) can sometimes make the R75 (using Bill's analogy) sound like it's further down inside that barrel! IMO after the fidelity mod the DSP emits a nicer sound.

how? how can cold weather alter an internal combustion engine's horsepower output? answer: via the input... post-mod the DSP and our ears are being fed higher frequencies. the DSP algorithm, designed for up to 5000 Hz, may even respond differently depending on what it is fed... just as an engine may respond to cold (dense) air with more oxygen content. i am able to turn the NR up much further now.

this is a audio scope plot of a similar noise signal both with and without noise reduction... the amplitude (distance from blue line) drops. i keep NR cranked up while DXing or 'surfing'... my ears are thankful.

this post is in response to comments by Bob (KB0XR)...

> The voice board was easy enough to install.
> I am underwhelmed by its performance though.
> It works but the audio level is quite low

the block diagram shows what appears to be a variable resistor (red)
that sets the speech level for the UT-102...

http://members.truepath.com/justrtfm/ut102a.gif

the schematic shows this resistor on the board...

http://members.truepath.com/justrtfm/ut102b.gif

i took pictures of this region while documenting the fidelity mod. if
anyone has adjusted this resistor please speak up and confirm its
function, location, what plastic item you used to turn the pot, and
any tips. note the position of the pre-amp chip (yellow), R1254
variable resistor (red circle), and R1254 board markings (red
rectangle) [all are close to the front left corner of the PCB].

http://members.truepath.com/justrtfm/ut102c.jpg

Bob, i do not own the UT-102 so please do not make any changes based
on the above... lets just sit back and wait for some feedback!

regards,
phil :)

2937. Off Topic - ILG Database Password

Date: 2002-11-17 16:27:28 UTC
From: John Pickrell
Topic: 2937 Message: 2938

Yes I use it on a daily basis (and Mark Fine's RLDB). There is also a stand alone version that will run under MS Excel or a "GNPDB" version (mini-DB program), I have all.

When I asked them for a PW it must have taken a month (in fact when it arrived I had forgotten I'd asked) so maybe patience (?) is the answer. I have none (patience) so I would bombard them with requests.

The ILG DB is due to be up-dated this month (now the later part of the month). When the up-date happens I will go back to the GNPDB version, I like it better (no R75 controls).

Join the club. I have also been waiting for months to get the password. If he has a problem with multiple responses, perhaps he should edit the line on his web page that says that this could take up to three days. After the weeks pass and no password, one wonders whether they may have made an email address typo or some other error. I'm afraid that I have also sent him two or three emails, so it is likely that my request has been black listed for life.

2943. Re: Report on 3khz Filter mod and Fidelity mod - Now S-AM v2.1

Yahoo group: icomr75 (2000 — 2002)
Date: 2002-11-17 23:31:30 UTC
From: jgedde
Topic: 2854 Message: 2943

Hi Phil,

First, I refer you to the calculations files I placed in the mods area.
These show the calculations used to determine the comparator threshold voltage and hysteresis. Simultaneous equations were used to calculate the values for the resistors. This may not be clear in the presentation.

Resistors R1 and R3 provide hysteresis. A small amount of positive feedback is used via R3 to change the voltage seen by the comparator's input whether the output is high or low.

R4, R5 and R6 set a threshold voltage that pin 23's output is compared to.

U1B, C and D are simply unused portions of the quad comparator. A single comparator could also be used, but is not available at Radio Shaft. I would suggest an AD790 in this case.

C2 is Rado's AGC mod.

Here's how my circuit differs from Rado's...

Basically, it does the same thing as Rado's mod, but is more forgiving because it uses a comparator with hysteresis, rather than relying on the
transistors VBE and base current. These change with temperature, and provide no hysteresis. In addition, the comparator provides a reasonably consistent input impedance with decreased loading to the Motorola IC's blend pin.

Also, a comparator is better in this case since the change in voltage coming from the Motorola IC only changes slightly when in-lock vs. out-of-lock. A simple transistor switch does not provide the precision threshold and the snap on-snap off behavior that a comparator with properly designed hysteresis provides.

The pot is required since there is no guarantee that the cap I used has
similar leakage characteristics to caps used by others. Large value elctrolytic caps have terrible tolerance specs and leakage characteristics. Electrolytic caps, with regard to leakage and tolerance, range from absolutely terrible to merely fair. IN addition, resistor tolerences are variables I have no control over.

The circuit could be made much better still if an Op Amp circuit were used to in order to create a large value capacitor simulator around a smaller value mylar or similar good quality dielectric cap. In addition, a buffer could be used to isolate the capacitance from the output on pin 23. Typically, it is not a great idea to drive into a large capacitor since it can cause instability. However, this would make the circuit much more difficult to build and debug. Contruction techniques would also play a role in how well the circuit would work. Hence, I would consider it unacceptable unless I were to lay-out a PC board and provide them.

Hence, the circuit I designed is good enough for the tinkerer, but should not be considered production quality. I should perhaps create a kit with the better circuit described above.... One that doesn't require a pot (yech!)... Perhaps even with the fidelity mod you came up
with built-in. Perhaps even one step further: use some sort of switching arrangement to optionally turn off the fidelity mod for CW, RTTY and SSB reception...

In any case, the same considerations apply to the AGC mod as well. A better circuit should be used here as well. Probably why Icom doesn't simply add a capacitor to make the AGC mod. It wouldn't be considered good design practice to tie a large value cap onto an IC pin and rely on
the capacitor's characteristics presently, and over time, or to risk instability.

Getting back to the circuit, the output is an open collector type used to pull the SS line down to ground to change the flashing S-AM indication. The SS line is held high by a pullup resistor already present in the R75.

Cheers,
John Gedde

hello John!

thank you very much for the great explaination! i will surely refer
back to your post.

> Perhaps even with the fidelity mod you came up with built-in.

:)... do you plan on doing the mod? if so and you have time e-mail
me... i am eager to have someone scrutinize the photos etc.

> Perhaps even one step further: use some sort of switching
> arrangement to optionally turn off the fidelity mod for CW,
> RTTY and SSB reception...

originally i thought of adding some type of quad analog switch run
off the SAM line but luck went our way... first the DSP was found to
function to 5000 Hz... second the mod did not effect SSB other than
an occasional twin-PBT twist being necessary. not a big deal since in
my mind the IF filters (and RF gain) ideally should be attenuating
the signal not active audio filters.

> Probably why Icom doesn't simply add a capacitor
> to make the AGC mod.

my first impression was that they followed the Motorola PDF too
closely but now i see your point.

regards and many thanks,
phil :)

2947. Re: Taking my R-75 on the road.

Yahoo group: icomr75 (2000 — 2002)

From: manabu662001
Topic: 2926 Message: 2947

Dear Mr.Lloyd,

I enjoy a mobile operation of R75 powered via cigar plug.
I use an optional OPC-863 cable supplied from ICOM, and
combinated it with cigar code purchased in DIY shop.

Operation is real pleasure, but only with engine off.
During engine on, heaby noise causes a significant interfer.

To prevent the problems, we need some technique such as
grounding, noise-filter,etc. But, I'm not a technician,so
I have a little to tell.

If My.Lloyd wants an operation in some stopping with engine
off, it is good.
The manual of R75 presents a caution "Do not operate with
engine off", but in my experience, a full 2hours operation
of R75 does not exhaust car battery. But, be carefull enough.
When a battery is already exhausted, the operation is not recommnded.

Manabu Doi,
a SWL in Okayama Japan

Lloyd - as you probably already know, Radio Shack can match a plug on their power units to almost any other coaxial power plug in existence, via their interchangeable plug system. The whole thing should cost less than about $12 if memory serves.

I haven't used mine mobile yet, but have seriously considered it at various times. I'd think you'd want to find out how well that NB works in your vehicle (assuming you have the UT-106 installed) before throwing all caution to the wind.

Good luck!

When you press the NR button, the NR indicator should "light", and assuming you have set the level to something in the middle (like the default) you should hear a definite reduction in the amount of hiss/roar. One can debate whether other DSPs are better or how much the improvement in S/N ratio is, but you will definitely hear a difference. If not, something is wrong.

Quite correct. The DSP does a couple of things in NR mode: It reduces the background noise modestly, improving the S/N ratio, and it also smooths out the noise to make it "whiter," and therefore less likely to obstruct intelligibility. Personally, I never shut it off, but adjust it between 4 and about 10 depending on the signal.

Garth,

I printed it (page 43, CI-V data example 3 and the Set Mode Data Table) - despite an error message. My version of Adobe 5.0 asked me if I wanted to load a current Japanese character set but then couldn't find it. It then said that the page might print with unreadable characters. As far as I can tell, the page that I printed matches the hard copy manual.

If you like I'll mail it to you - no charge! Just get me an address offline. Or I can fax it to you.

I hope you're right about Icom/TenTec - the RX350 especially shows promise - but I would very much like to see Drake produce a class-act R-8 series rig with IF-DSP. How could it be beat? At the same price as an NRD-545, it would blow away amnything else in the price range.

Of course, an Icom R75 with a few touch-up fixes would accomplish 98% the same thing with 2/3 the price tag :-)

The warning not to operate the R75 with the ignition off is to avoid potentially damaging voltage spikes when the vehicle is started. So, disconnect the R75 before starting the engine.

Subject: [icomr75] Re: Taking my R-75 on the road.

Dear Mr.Lloyd,

I enjoy a mobile operation of R75 powered via cigar plug.
I use an optional OPC-863 cable supplied from ICOM, and
combinated it with cigar code purchased in DIY shop.

Operation is real pleasure, but only with engine off.
During engine on, heaby noise causes a significant interfer.

To prevent the problems, we need some technique such as
grounding, noise-filter,etc. But, I'm not a technician,so
I have a little to tell.

If My.Lloyd wants an operation in some stopping with engine
off, it is good.
The manual of R75 presents a caution "Do not operate with
engine off", but in my experience, a full 2hours operation
of R75 does not exhaust car battery. But, be carefull enough.
When a battery is already exhausted, the operation is not recommnded.

howdy Bruce!

random thoughts... some on the RX-350 board appear disappointed with the radio. i too would like Drake to produce IF DSP radios... give TenTec and ICOM some ham competition. FWIW, an R75 with AM-AGC, Sync-AM, and fidelity mods is still 1/3 the price of an NRD-545.

i may offer a version of some software i've been using since july. start the program... press a button... wait 80 seconds... and voila you can step through all active AM stations from 120 Meters to 11 Meters... no hunting for what is on! i just fired it up 10 minutes ago and it found 94 stations... sure beats knob turning.

regards,
phil :)

As to the Frankenstein designation - I'll take it with pride, but
there is still lots of open space in the radio!

This reminds me about my Icom R72....
Is had 2 big PCB boards and internal mains and a lot of wire! It was wiers
everywhere and coax.
So when I got my R75 and opened it up I got very surprised.

Hey, they must have forgot something here!

The R75 is empty compared with the R72. :-D
So much can happens in 10 years...

BTW I just did the AGC mod. So it is time to se if it works.
But i did not do it myself, not on a radio for $1100...

Hi Payman,

I'm the one who got this unit via "Buy it now". When it arrives I'm jumping in with the usual mods for the R75. I look forward to controlling it along with my RX-320 and AR-7030 with the ERGO 4 software. I live a couple of hours from the Washington State coast where I like to go for trans-Pacific mediumwave and tropical band DXing.

I'm looking forward to this receiver! I hadn't paid much attention to it when it was introduced in 1999, but now I realize that it's quite a value for the money.

I recently moved to a new town, so I don't have the gear & antennas up yet. After I get minor matters like unpacking out of the way, then the fun begins :^)

2963. Kiwa MAP Unit Hookup to R75

Yahoo group: icomr75 (2000 — 2002)
Date: 2002-11-19 20:21:42 UTC
From: thinkdx
Topic: 2963 Message: 2963

Has anyone successfully hooked a Kiwa "MAP" to the R75's product detector, IC1101? This is a post-455 IF filter location that looks suitable for the direct pickup connection of the MAP, but I'm wondering about the proper pin.

Would it be pin #6, the "+OUT" pin of IC1101?

Thanks in advance for any tips on this "old tech/new tech" equipment hookup of the MAP and the R75.

dx@...
Puyallup, WA USA

2964. ICOM R75 vs 706MKIIG

Yahoo group: icomr75 (2000 — 2002)
Date: 2002-11-19 21:57:24 UTC
From: gollersam
Topic: 2964 Message: 2964

The 706MKIIG covers the frequencies of .03-199.999 MHZ + 400-470 MHZ.

The R75 covers .03-60 MHZ.

Both offer USB, LSB, CW, RTTY, AM, FM,
The 706 offers WFM
The R75 offers S-AM

A fully modified R75 costs about $800. An out-of-the-box 706 costs
about $800.

They both use the UT-106 DSP.

Besides the obvious (the 706 is a transceiver and the R75 is a
receiver)what other differences are their between these two? As a
newly licensed ham (1 year), I'm interested in listening to the HF
ham bands with the occassional up&down the dial into SWL.

I like the 706 because it allows me to take advantage of my
priviledges on 2m, 70cm & 6m. As a receiver in the HF ham bands and
for SWL, which would do the better job?

Look forward to reading the dialogue. Thanks in advance for sharing
your opinions.

From: grant390
Topic: 2964 Message: 2965

As an owner of both, I would have to say that the R75 has the edge as a receiver. I believe that the recieve electronics are very similar between the two. I dont find that one will recieve things that the other won't. The signal hadling abilities of these two rigs is very similar.

The R75 wins as a receiver because it has direct frequency entry; instant access to DSP and filter controls; a nicer front panel layout; SAM mode for fading AM signals; and other creature comforts I can't think of at the moment.

Don't get me wrong, I really like my 706IIG, but it is more optimized for its trancieve capabilities oriented to mobile operations. It has a very compact design with few controls. Hence the need for menus and lots of button presses for infrequently used controls. It is much better suited to the needs of a ham that uses multiple bands than for SWL.

You can alleviate some of the user interface limitations with computer control.

I love them both and often have both running at the same time!

From: payman_a
Topic: 2964 Message: 2967

Sam,

The ARRL tested the 706MKIIG in July 1999. Just looking at the numbers, and comparing them with those for the R75 (tested January 2000), one comes up with the following conclusions:

Noise floor - comprable

AM Sensitivity - MW: R75 almost twice as sensitive. SW: 706MKIIG more sensitive (almost but not quite twice)

FM Sensitivity - 706MKIIG the same or more sensitive by factor of 2-4

Blocking dynamic range - slight edge to R75, almost comparable

Two-tone third order IMD dynamic range - slight edge to 706MKIIG, almost comparable

Third-order intercept - R75 takes it by wide margin

Second-order intercept - R75 takes it by wide margin

Spurious and image rejection - 706MKIIG take it by wide margin.

Have you thought of using an Icom IC-718 as the 'transmitter' in your setup, or just using it for both receive and transmit? It can be connected to the R75, and can control it. Price is comparable to the R75.

payman

I see you've got the Ergo software. I would like to use a software with my new R75 but don't know which one to choose. I see that the option RS-R75 software is on sale at Universal for $59.95, while the Ergo software is listed for 99$. Looks like the Ergo does more, but is it worth the price? And I guess I would need to get the CI-V Converter for the connection.

On another topic, I live in Seattle. Is there a local dx club? From the WA coast, do you get yourself far enough from the SEATAC QRM?

2969. Drake R-8B for $790

Yahoo group: icomr75 (2000 — 2002)
Date: 2002-11-20 06:34:01 UTC
From: payman_a
Topic: 2969 Message: 2969

Well, after the $400 R75 find on ebay, here is a used Drake R-8B for sale by Universal Radio at $789.95. Look for item number U069 in http://universal-radio.com/alert.html if interested.

I wish I had the money to get this and see what all the praise the R-8B gets is all about ...

Hi Bruce,

I have another DXpedition trip to Grayland, WA planned for Dec. 6-8, although it won't be as "serious" a DX session as usual. This time I'm heading out with my 11-year-old, who likes to tune in the PNG regionals and the stronger Indonesians. Mostly, I think she likes to crash through the brush while stringing the Beverage antenna wire... she's a bit of an adventurer. The sand and waves at the beach are an attraction for any kid, of course... but the WA coast in December may be more rainy and windy than she expects!

Anyway, I don't think I'll spend as much time at the dials as usual during during this DXpedition, but I plan to do a lot of "A-B" comparisons between the receivers on trans-Pacific MW and the tropicals. Nor will I have as many Beverage antennas available (maybe just one or two). See this link for a photo of the antennas we Washington State area DXers usually employ at Grayland:

http://briefcase.yahoo.com/thinkdx

Look in the "MW & Tropical Band DXing" folder, and then in the "DX Photos & Misc" folder. Inside is a "Grayland DXpedition Antennas" photo.

HI, Guy - sounds great...it's neat to have kids that are interested in your hobbies (mine isn't quite there yet). BTW, I went to the page you mentioned, found the thumbnail, but it wouldn't open up. Looks like a beautiful place though. Do you usually keep re-running Beverages according to what you want to hear at a given time, or does one (or a couple of) runs fit all? In other words, are they so directional that you need several or new runs??

2972. My R-75 don't like my antenna?

Yahoo group: icomr75 (2000 — 2002)
Date: 2002-11-20 17:28:54 UTC
From: Bill Brady
Topic: 2927 Message: 2972

Hi gang,
I am going a tad nuts trying to figure out why my R-75 don't like my 60' DX/SWL Sloper.

I have the antenna feeding either the R-75 or M800 via a two pole co-ax antenna switch. So I can instantly put either radio on the Sloper.

I also have a wire run around the top of the walls inside most of my house. I usually use this for whatever portable I am using, mostly my 2010.

The M800 works splendidly on the Sloper, the R-75 works good on the random wire. The R-75 barfs on the Sloper. It goes from S9 +20dbm to S1 when I switch.

I put a MFJ 956 in the line... no help. I modified the MJF 956, no help (perhaps a tad worse for the R-75).

Any ideas?

Sounds like a short in your switch. Is that possible? Have you tried
connecting the R75 directly to the sloper?

Yeah but the NRD-545 (and RX-350) has all those cool IF DSP goodies. R75 has none. However, I seriously doubt that NRD or TenTec is 2 or 3 times better than the Icom, DSP included.

The TenTec appears to need some improved firmware specs, dynamic range and so forth. I have no doubt that TenTec can do it if they want to - if they are like Drake, perhaps they will do some real improvements for the RX-360.

This sounds neat. Can you adjust the sensitivity to only pick out S7 or above stations, for example? I envy you your ability to funnel those creative juices into hobby fun - all of mine go into raising a family these days.

2975. DSP question

Yahoo group: icomr75 (2000 — 2002)
Date: 2002-11-20 18:55:25 UTC
From: Bill Brady
Topic: 2927 Message: 2975

While we are problem solving, what is the difference between NR and ANF settings of the DSP? I notice that NR gives me a larger drop in volume but eliminates more noise than the ANF. The ANF also degrades the fidelity more. And if I use both, that's when the sound is like someone talking from the bottom of a barrel.

Jus' wonderin'

Bruce Jensen

Many thanks Bruce for your reply,

I have never tried to hook the R-75 directly to the Sloper, it's a bit difficult (cable too short). I realized that the only other thing was the patch cable from the switch to the R-75. I put an ohmmeter on the center conductor and it was open!

I tore the cable down and noticed a bit of a hump in the middle. Somehow the center conductor had broken or a manufacturing splice gave away. I made a new cable and the R-75 now happily receives lots of juice from the sloper.

It's still a bit strange however, as the R-75 does work better on the in house wire for some frequencies. For example, WWV 20MHz screams from the wire, but drops a few dbm on the Sloper. More testing is required now.

Anyway, when I ordered the cable the dealer called me and asked if I could live with 2 50' pieces instead of the 100' I ordered. They actually sent a chunk about 60' and another close to that. Methinks they knew they had some bad cable.

Use NR when the background noise is annoying, and adjust to suit your taste using the proper sequence of buttons and the tuning knob. Usually about 4 to 6 is right for optimum reduction.

ANF (auto notch follow) is for reducing heterodyne tones and other midrange whistle or tone noises. Turn it on only when those tones or whistles are present and annoying. NB is a noise blanker, and reduced impulse-type noise (rapid regular rat-a-tats, for example). It has very limited usefulness on static, and should not be used on strong signals.

All of these work to some extent. Mine work well for me, if not always 100% effective. Your mileage may vary, but only experimentation will tell you how valuable any one control can be to you.

2978. Re: DXpeditions (Was: RE: $400 R75 on Ebay)

Yahoo group: icomr75 (2000 — 2002)
Date: 2002-11-20 20:01:02 UTC
From: thinkdx
Topic: 2927 Message: 2978

Bruce,

I just checked the link and it worked for me (I assume you clicked "full size"?). If you can't pull it up, let me know and I can email it to you if interested. It's about 400Kb compressed JPG, but the picture is a 360-degree panoramic photo of the entire antenna "farm".

The usual array of antennas there is a southwest, west, and northwest terminated Beverages. These are often the dual-wire Beverage design, spaced about 6 feet apart, parallel. The dual type gives a bit more gain (although we run everything through Advanced Receiver Research preamps). Each Beverage is 800-1000 ft. long depending on the orientation. These three cover all the directions monitored on MW, and are satisfactory for Asia, Pacific, and Africa (morning longpath only) on the tropical bands. The antennas are a blast to have available, but it can be a drag to take it all down in a blustery Nor'wester!

For the DXpedition in the photo we had two K9AYs and a ALA 1530 loop erected also.

regards,

From: Guy Atkins
Topic: 2980 Message: 2982

Hi Al,

The email I have for Bruce is: bportzer@... Hopefully this is
still current, as I haven't corresponded with him in months.

He welcomes any and all newcomers to his February (Saturday) get-together.
The attendance varies... it runs from around 1 or 2pm until as late as
anyone cares to stay. Pizza is ordered around 6pm! Usually the group ends
up in Bruce's basement radio shack.

I checked in to the Yahoo.com "Briefcase" site where I have those pictures,
reviews, DX audio, etc. stored. I notice that they've changed things around
and have added a "Premium Services" (= $$) which allows viewing of full
size pictures. Sorry about that! I didn't realize that it had become a pay
service for most features. I'm between hosting companies for my own web site
(I recently moved to another town) and I need to get some more web space
with an internet hosting company. Then I can post a link to my panoramic
Grayland DXpedition antenna photo.

Are you familiar with the T2FD antenna? This is a versatile antenna that has
a wide bandwidth and omnidirectional reception with low noise qualities. I
wrote an article about it which is accessible on the Hard-Core-DX web site.
Also, I'd highly recommend the K9AY antenna which you can build yourself
(with some effort) or go for the commercial version from Wellbrook
Communications or AY Technologies. The K9AY is also low noise, plus it's
very directional on MW.

regards,

Guy

hi Bruce!

> Yeah but the NRD-545 (and RX-350) has all those
> cool IF DSP goodies. R75 has none.

IMO both have inadequate ADCs... i'll stick with the twin-PBT and audio DSP. after the AM-AGC mod, Rado's Sync-AM mod, and my fidelity mod... there is now no way i'll be buying another radio.

> However, I seriously doubt that NRD or TenTec is 2 or 3 times
> better than the Icom, DSP included.

sensitivity and selectivity are better on the ICOM. IMO most of the Passport reviewed radios are in a similar class although some have more features, better build quality, etc. to break out, a big buck rig (Racal / Harris / Collins) and antenna reale estate are needed.

> Can you adjust the sensitivity to only pick out S7 or
> above stations, for example?

what you can do is cut back the RF gain. the program automatically organizes stations after the scan... you just click through and stop where you want. (i use an advanced version that is not so user friendly yet). my software does not use the s-meter... instead audio is pumped in via the soundcard and analyzed using my software DSP. the DSP has ~100 dB of dynamic range.

> I envy you your ability to funnel those creative juices
> into hobby fun - all of mine go into raising a family
> these days.

no family to raise here yet... i better enjoy it while i can ;).

Hi Bill,

I didn't realize that it was a pm from Guy. Here's what he said:

Hi Al,

I like ERGO a lot, but haven't spent much time with other packages. I feel that it is a very sophisticated and polished package for the money. I started helping out the author, John Fallows, as a beta tester for ERGO with the AR7030 in 1996. I've seen the program evolve much over the years. Mr. Fallows is a talented software writer... I had the chance to meet him this spring at a DXpedition.

As far as I know, ERGO is the least expensive package that offers these sorts of advanced features:

-multiple receiver control simultaneously
-remote operation via TCP/IP or DCOM (internet or wired/wireless link)
-import of virtually any database out there
-flexible grayline map display showing long & short signal paths, realtime terminator, etc.

ERGO would work through the R75's RS-232C connector on the back... same for the Kenwood software I'm pretty sure. There would be no need for the level converter unless you were hooking it up to other Kenwood equipment like a transceiver.

Thanks Al!

I really don't need to hear how wonderful anything is right now after laying out the money for the R-75 recently- it's been great out of the box. But of course one always looks for more even with such a bargain so I appreciate the help for something I shouldn't consider right now.

I *do* appreciate the info though.

2987. The DSP from hell!!

Yahoo group: icomr75 (2000 — 2002)
Date: 2002-11-21 06:15:36 UTC
From: kabjkm2002
Topic: 2987 Message: 2987

I ordered the DSP unit after purchasing the ICR75. Happily it arrived in only 2 weeks - the downside is Icom sent the UT 96 (a five tone board) instead. I sent it back and three weeks later the correct unit arrived. I installed it using the flimsy instructions in the manual and the postings on this site. I turned it on and saw DSP in the display but there was no audio out - dead as a door nail. I reopened the unit (all 3000 screws), unplugged and reattached all the connectors. This time I left the case off - turned it on again - no audio. Then I fiddled with the wires and the radio came to life. Apparently there is an intermittant connection in the wiring. I finally installed the velcro and case in a way so the intermittant problem is solved. Now the NR function works good but the Auto Notch Filter doesn't. I tuned some CW signals in SSB mode and pressed ANF - nothing. So now I suppose I can send it back to Icom and hope they send a working unit of the right item or I can forget about the whole thing. I think I'll choose the latter. AB7JK

2988. Re: [icomr75] question about audio conrol

Yahoo group: icomr75 (2000 — 2002)

From: Radostin Danev
Topic: 2913 Message: 2988

The volume control is not analog. The pot is connected to an ADC input of the CPU. The CPU then sends voltage (from an DAC output pin) to the volume control IC (IC1251). This is why there is such step-wise action of the volume knob, noticeable especially at the beginning of the range. This design also alows for volume control through software, without touching the volume control knob.

Regards,

Rado

Hi,
There are cases where the UT106/ANF would have problems, fast CW is one.
I suggest you test the ANF with a stable het, eg a AM-station on SSB,
slightly off frequency.

(IMO, the MFJ-784B is superior regarding notches (both in auto and in
manual-mode).
Also the NB7030 (non-DSP) for the AR7030 seems better, although it can only
cope with one het.)

Subject: [icomr75] The DSP from hell!!

I ordered the DSP unit after purchasing the ICR75. Happily it arrived
in only 2 weeks - the downside is Icom sent the UT 96 (a five tone
board) instead. I sent it back and three weeks later the correct unit
arrived. I installed it using the flimsy instructions in the manual
and the postings on this site. I turned it on and saw DSP in the
display but there was no audio out - dead as a door nail. I reopened
the unit (all 3000 screws), unplugged and reattached all the
connectors. This time I left the case off - turned it on again - no
audio. Then I fiddled with the wires and the radio came to life.
Apparently there is an intermittant connection in the wiring. I
finally installed the velcro and case in a way so the intermittant
problem is solved. Now the NR function works good but the Auto Notch
Filter doesn't. I tuned some CW signals in SSB mode and pressed ANF -
nothing. So now I suppose I can send it back to Icom and hope they
send a working unit of the right item or I can forget about the whole
thing. I think I'll choose the latter. AB7JK

The NR or noise reduction and the ANF or automatic notch function are
both part
of the
UT-106 DSP option.DSP UNIT WITH AUTOVARIABLE NOTCH FILTER HELP
IMPROVE INTELLIGIBILITY OF TOUGH SIGNALS AND REDUCE HETERODYNES
INTERFERENCE. You can adjust the NR level from 1 to 5 and it very
effectively reduces background static (white noise) while allowing
the signal
to stand out. The received AF signals are converted to digital
signals and then
the desired signals are separated from the noise. I leave my NR on
and set on 3
or 4 and increase the level as needed. Your opinion is that the NR
isn't
impressive. I find this feature very effective and from the posts
I've read,
I'm not alone.
The ANF function automatically attenuates more than 3 beat tones,
tuning
signals, etc., even if they are moving. All you have to do to test the
effectiveness of either of the above functions is just turn them off.
The
effectiveness is obvious and in my opinion this level of DSP is what
separates
the R75 from other receivers AND WITH THE PHIL'S EASY FIDELITY MOD
[add [4] 47k resistors in parallel]the DSP feature really shine.

Phil, or anyone

As I look at my S-Meter with the RF gain at maximum the display is totally understandable (I.E. at some level with a variation relative to modulation). But, as one decreases the RF gain the S-Meter reading increases and the slight variations, due to modulation, decrease to non-existence.

Just what am I looking at. How do I relate this reading to a report "you are S9+10" for example.

It's not a problem. An automatic notch filter are delibrate done with a high time constant. You could probably alter a capacitor in the UT106 to make it track faster and it would then try it best to mask out speech. You would then end up with a almost silent R75 without anything to listen to, if that is what you want from an ANF. If you monitor a conversation with a small heterodyn and you had a low time constant for the tracking, it would try and follow, and notch out, the speech and not the unwanted het.

You are actually looking at the RF gain, where lower S-meter values mean more gain and higher values mean less; you are not looking at the actual signal strength. The meter is tied into the AGC, or at least it is on my old Collins 73A. As the signal gets weaker, the AGC calls for more gain, and the meter "moves" to the left. I think in the older receivers, lower AGC voltage means more RF gain, so that's why the meters behave that way. The R75 may be the same, or the computer might just simulate it. Anyway, when you turn the RF gain knob counter-clockwise, you are limiting the gain. Since you are actually looking at the RF gain, not the actual signal strength, the meter moves to the right. Only when RF gain knob is straight up and the AGC is fully automatic does the S-meter represent actual signal strength.

From: Gary Kinsman
Topic: 3000 Message: 3000

Hello group,

Why can't optional Icom filters such as the FL-257 3.3 kHz filter be used in sync AM mode, but the Kiwa 3.8 kHz filter can be? Is it the location of the filter (soldered in vs plug in) or the bandwidth that is the restriction?

When a Kiwa 3.8 kHz filter is installed, how is it configured in filter set mode, since it's not a filter listed in the menu?

How well does the Kiwa filter work in SSB? It seems like it might be too wide to be practical, whereas the 3.3 kHz filter seems to work well, based on previous posts.

Is it possible to use the Kiwa 3.8 kHz filter for SAM and the Icom 3.3 kHz filter for SSB?

Thanks much,
Gary

Larry,

Thanks for your reply. In 3 calls to ICOM, the last to the "wizard", that is the best answer I've received.

I accept all of your reply about the meter response and AGC action, but...

What defies explanation, at least to me, is the action of the S-meter as variable RF gain decreases-the meter reading increases, If the meter measures gain at any position other than 12:00 o'clock it should decrease with a decrease of the RF gain. If, for example, a reasonably strong station is tuned and the attneuator is switched in/out the meter reacts as expected, I.E. high with the ATT out and Low with it in.

By the way, ICOM's answer, "don't let it bother you, enjoy the radio."

You sound like a commercial for Icom. On further testing the ANF does remove faint heterodynes from AM signals. However a quality ANF will totally zap a cw signal - all you'll hear is a muffled clicking as the carrier turns on and off - not so this filter. With a quality ANF a ham station tuning up 3 kilohertz away disappears completely. So it's free - it should be! If noise is a problem this filter won't help alot - if it's not you don't need the filter anyway. AB7JK

Please don,t get mislead by words.Some call it "the DSP of hell"
others "the DSP of heaven".It is only a personal preference issue not
a commercial issue.I give my arguments about why I like it.About
commercials WRTH 2000 rated it "Best value table-top receiver and
passport 2002 writed about it "R-75 is a first-rate receiver for
unearthing tough utility and ham signals.The DSP is only a tool but
don't do miracles.I had read reviews about more expensive DSP's that
in some areas have flaws.What I did is stop complainig and start
fixing the freq response range of the DSP with the Phil's fidelity
mod and now I,m very happy with the results.

3007. R75 question

Yahoo group: icomr75 (2000 — 2002)
Date: 2002-11-23 17:27:29 UTC
From: Russ Kiehne
Topic: 3007 Message: 3007

Greetings, I'm blind and I'm thinking about buying the R75 because of having the speech synthesizer option. I downloaded the manual from the files section and it's not readable with my Acrobat reader with speech access. I'm wondering if someone would be kind enough to discribe the radio like the following:

The front can be broken into four areas. The speaker, the display, the bottom row of controls and the rest of the controls.

The speaker is on the left. The display makes up the top right quarter of the front.

The bottom row of controls, from left to right.

Power switch, square.
Headphone jack, 1/8 inch, stereo.
Volume knob.
Bass knob.
Treble knob.
Squelch for aircraft band. Turn full right for open squelch.
Attenuator button. Tall rectangle.
AGC button. Tall rectangle.
IF bandwidth button. Round. Each press cycles through 6, 4 and 2.3 kHz bandwidth.
AM/sync button. Round. Selects AM mode. Toggles between AM mode and sync mode.
SSB/USB/LSB button, round. Selects SSB mode and toggles between USB and LSB.
Band Button, round. Cycles through air, FM, short-wave and AM modes.

The rest of the controls. These are below the display. I'll describe them in four groups.

Rightmost is the tuning knob. Immediately to the left are up and down tuning buttons. They are tall rectangles. Tune up is above the tune down button.

Leftmost, and near the center of the radio are three rectangular buttons that are twice as wide as they are tall. They are arranged one above the other. The top is the 'clock' button for displaying the time. In the middle is the timer button. On the bottom is the lamp button.

To the right of these buttons is the numeric keypad. It is four rows of three buttons each.
1, 2, 3 in the top row.

4, 5, 6 in the second row.
7, 8, 9 in the third row.
0, period and clear are in the bottom row.
Tuning is done by entering a frequency appropriate to the band you are in. AM and short-wave frequencies are entered in kHz. FM and air frequencies are entered in MHz. The decimal point can be used for fractional frequencies. After the frequency is entered the radio will jump to the frequency. Either immediately or after a few seconds. If you have entered enough digits after the decimal point the jump is immediate. Otherwise the radio will wait two seconds an then jump. Also, the decimal point button acts as an enter key. You can enter digits up to the decimal and press the decimal point twice to jump immediately to the frequency.

Holding the clear button in for a few seconds will lock the keypad. Repeat to unlock.

To the right of the numeric keypad are eight miscellaneous buttons. They are arranged as two columns of four wider then tall buttons each.
The left column, top to bottom.
STORE.
BEEP.
SKIP.
DELETE.
The rightcolumn, top to bottom.
MEMORY.
VFO.
SW BAND.
SCAN.

That is it for the front controls.

There are two groups of connections on the back. One for antenna and the other for power and audio connections.

Facing the back of the radio, the antenna connections are on the lower left. From left to right you have the low frequency antenna selector switch, the high frequency antenna selector, and 'F' connector for the FM/AIR antenna, two pus terminals for the 500 ohm wire antenna, first the ground, then the signal connector and finally the SO-329 short-wave antenna connector.

The first switch has the 'whip', '50 ohm', and '500 ohm' antenna positions.

The second switch and 'whip' and 'F connector' settings.

Hint:For the switches, the whip positions are closer to the end of the radio and the screw on connector positions are toward the middle of the radio.

Finally, on the lower right of the back you find the left and right phono or line outputs, the power connector and the external speaker connector.

The battery cover is a big sliding panel in the center of the back. There is a ribbed surface to assist in sliding it to the left or right. Six D batteries are used. On the top row the tops of the battery point toward the whip antenna. The tops of the batteries in the bottom row point away from the whip antenna.

3008. Re: Optional Filters in Sync AM

From: Gary Kinsman
Topic: 3000 Message: 3008

Thanks, Gert, for explaining why the 455 kHz filters can't be used for S-AM. The wealth of knowledge in this group is truly amazing, and I enjoy reading all the posts.

Since we're on a roll here, does anyone have answers to my other three questions?

When a Kiwa 3.8 kHz filter is installed, how is it configured in filter set mode, since it's not a filter listed in the menu?

How well does the Kiwa filter work in SSB? It seems like it might be too wide to be practical, whereas the 3.3 kHz filter seems to work well, based on previous posts.

Is it possible to use the Kiwa 3.8 kHz filter for SAM and the Icom 3.3 kHz filter for SSB?

Thanks again,
Gary

This really depends on where you put your 3,8 kHz filter. If you replace the 15 kHz filter you should choose 455 kHz 15 to get the 3,8 kHz.

The 3,8 kHz will be vrey good for better audio response in AM. However you have to adjust the PBT to get the filter in the correct position. I use my 3,3 kHz most of the time to receive AM station in the SSB mode. I always use the widest filter possible in every moment to get good audio response and brighter sound.

Subject: [icomr75] Re: Optional Filters in Sync AM

Thanks, Gert, for explaining why the 455 kHz filters can't be used
for S-AM. The wealth of knowledge in this group is truly amazing, and
I enjoy reading all the posts.

Since we're on a roll here, does anyone have answers to my other
three questions?

When a Kiwa 3.8 kHz filter is installed, how is it configured in
filter set mode, since it's not a filter listed in the menu?

How well does the Kiwa filter work in SSB? It seems like it might be
too wide to be practical, whereas the 3.3 kHz filter seems to work
well, based on previous posts.

Is it possible to use the Kiwa 3.8 kHz filter for SAM and the Icom
3.3 kHz filter for SSB?

Thanks again,
Gary

HI Garry:The answer is that after the kiwa 3.8khz filter installation
the stock 6khz filter become the 15khz filter in the menu list and
the kiwa 3.8 khz become the 6khz in the menu list.After the
installation of the kiwa 3.8 filter the twin PBT working range
perfomance improve.

the ANF will remove strong or faint heterodynes. it will also remove
more at one time than ICOM quoted in its literature. the ANF does
better muting CW in SSB versus AM mode.

> So it's free - it should be!

i agree... now go tell that to the makers of the Sat800, Palstar,
FRoG, R8B, and 7030+.

I am thinking about installing the FL232 crystal filter in the 9 MHz slot of my R75. I do NOT want to lose the ability to use the factory settings for S-AM and SSB (i.e., 15, 6 and 2.4 kHz and 6, 2.4 and 2.4 kHz respectively). Can some of the filter gurus out there tell me if I will have anything other than those factory settings after I install the 350 Hz crystal in the 9 MHz IF slot? Of course, I'm thinking of using the 350 Hz crystal only for CW / RTTY narrow.

Thanks in advance for any help!

Hi Don,

I can't say about the Icom software and XP but I chose to use SmartIcom (www.fineware-swl.com) for the R75 which, as I understand, is fully XP compatible. The fineware RLDB makes a great compatible database as well.

I'm a fan of the ERGO software package, which supports multiple receivers (simultaneously, if you have the serial ports available). It can also import many database formats including the ILG. You can read the details at:

I am also thinking of installing an optional narrow filter for future CW work. My question to the amateurs out there : What would be the best choice of filters, considering the pileups on the bands? The choices ICOM offers in the 9MHz slot are the FL-100(500Hz), FL232(350Hz), and the FL101(250Hz). Would the FL101(250Hz) cause difficulties tuning? Is the FL100 too broad?

I just put a 250 in my IC718 and it is terrific. Just be sure you turn on the .00 tuning option so that you don't fly right over the cw operator you are hunting. Once you turn on the 250 Hz filter, the radio will be RAZOR sharp. It will totally block all the QRM from other close-by operators. I highly suggest it. The reason I am putting the 350 in is because I already have the 250 in my IC718, and . . . . it is pretty cheap actually -- only $80 from Universal Radio. Too bad International Radio doesn't have one -- they'd probably sell it for $50! If I had to go for one or the other, I would probably pick the 350 Hz filter though -- it would be a good compromise versus the 500 Hz crystals. You'll see a drastic difference.

Good luck,
Alan

Go with the FineWare (as others suggest) which DOES work on XP, but for future reference, I know that you can make an application in XP 'think' that it is running on 95/98, by fumbling with some setting -- I haven't done it, but I know it is possible in XP.

K0ADL,

Thanks for the feedback. I figured that for tuning around I'd leave it on a wider setting, and then narrow it down to eliminate interference. Perhaps I'll go with the 250Hz.

From: goldcitybeads
Topic: 788 Message: 3023

Don, I purchased the R75 software when I purchased my radio. I had trouble using it with XP on my laptop. I asked Icom if there would be updates on the software. They advised they were not going to update it and to try another package they are pushing which is very expensive since the euro is equal almost to the dollar. It was the Bonito software. I tried to get the demo and it just allowed me to see the program not actually use it. I don't like investing approx 200 dollars for something I can't even try with my radio. I personally like the fineware package best. They give you 60 days to try it and see if it is good. Does what I need and has good support. I also tried the Ergo software and found it a bit cumbersome and had hardly any radio control. Hope this helps.

Topic: 3029 Message: 3029

I have been using the Fineware software for 2 days now, and it seems to fit the bill. I have only one problem, the constant beeping which can only be shut off by turning off the sound systems. Other than this all functions work great.

I have used 3 DB-9 F/M serial cables. I have checked the beep off. Has anyone else had this problem? Would appreciate any and all comments. Thanks.

Have a beautiful Drake R8 and MS-8 speaker, box, R8 literature, and
manual to trade for R75 with DSP and Kiwa or similar mods in similar
condition. This is one of the nicest R8's you'll see! R75 must be
MINT also! No cosmetic flaws please. Will double box and guarantee
satisfaction!

3036. Voice Synth

Yahoo group: icomr75 (2000 — 2002)
Date: 2002-11-27 05:23:23 UTC
From: Bill Brady
Topic: 3027 Message: 3036

Well, The UT-102 Voice Synth arrived today and I installed in my R-75. It was easy to do, with only minor annoyance from the wires for the V2.1 mods which crossed the UT-102 real estate on the way to the satellite board for the mod. Sorry for the run on there.

So I guess this means I'll keep the R-75.

Hi DeWayne, I'm blind and I'm thinking about buying a r75. I'm still doing research on them. I like the fact it has a voice synthesizer option. I used to own an Icom 751A with speech readout and optional keypad for direct frequency access. I'd like to have a Drake r8b but don't have that much money! On the Radio Plus site, they get the top rating.

As far as I know the Drakes don't have the voice option. I owned an R8B but I like the R8 a little better. The problem with the R75 is the AM audio, not good, but I definitely would not pay the price for a new R8B! I owned an R75 before I got the R8 and the R8's AM is far superior to an unmodified R75, that's why I am looking for a modified R75, or maybe I'll modify one myself. I love to try different radios.
DeWayne

I'm currently using the Grundig Satellit 800 and I really like the sound and ergonomics. The only thing the 800 doesn't have is, noise blanker, passband tuning and notch filter. I'd like to have these options. I've heard the r75 has attenuation on both mw and lw, the sync loses lock on weak signals, the sync uses both sidebands. Why Icom did this, is beyond me. With my 800sync, I can select what sideband I want to get rid of adjacent interference.

Why would Icom omit so many simple mods that the average person can do at very little cost? Strange indeed! Seems to me the R75 could have been such a nice all around stock radio with very little effort from Icom.
DeWayne

howdy Mark!

you are probably aware of this but i'll mention it here for others.
what i use to power-up the ICOM is the command &H18 &H01 followed by
a 1500 mS delay before i start sending data (probably could be
shorter but i have not bothered to test it yet).

the R75 manual is WRONG. it states that &H18 &H00 will turn the radio
ON and &H18 &H01 will turn the radio OFF... they got them switched!
if someone were to use what ICOM wrote their software would not power-
up the radio but a toggle between on/off would still function.

IMO your software is the best control program for the R75.

regards,
phil :)

> The problem with the R75 is the AM audio

i could not agree more. DeWayne do the AM-AGC, Sync-AM, AND fidelity
mods. make sure to read my surface-mount soldering course PDF in the
files section if you do them yourself.

the following wav demonstrates the fidelity mod using 15 kHz filters.
DSP NR is engaged for ~4200 Hz fidelity... at 10 seconds it is turned
off, yielding ~6200 Hz fidelity.

http://members.truepath.com/justrtfm/philmod.wav

hi Russ:

yes the R75 has attenuation below 1.6 MHz, the sync and AGC need repairs as per Kiwa or equivalent. you can however select a sideband during sync by engaging the dual 2.4 kHz filters and either detuning by plus or minus 1.2 kHz or turning the PBT all the way to one side or the other... this method is very effective.

phil :)

3045. Re: R75 question

Date: 2002-11-27 21:01:55 UTC
From: just_rtfm
Topic: 3007 Message: 3045

hi Russ:

here is my description of the R75 for you. sorry i forgot to send it the other day. the radio is small about the size of a sheet of paper but four inches tall.

i will break the radio into four sections from right to left that i will call left, display, knob, and right. on the left is a small speaker. from left to right below the speaker is a quarter inch phone jack followed by the power switch.

the next section is a display. below the display exists two sets of inner and outer knobs. the inner left knob is for audio volume, the outer left knob is for both RF gain and squelch. the inner right knob is the 455 kilo hertz passband tuning knob, the outer right knob is the 9 mega hertz passband tuning knob. to the right of these knobs are two buttons. the top button controls antenna selection and a setup menu. the bottom button controls clock functions.

below the knobs and these two buttons is an area with six buttons. from left to right they control the pre amplifier, attenuator, noise reduction, automatic notch filter, noise blanker, and automatic gain control.

the next section contains six buttons and the tuning dial below them. the buttons are arranged in two rows of three buttons across. the top buttons from left to right control single sideband mode, morse code or RTTY mode, and the filter setup menu. the lower buttons control AM mode, FM mode, and tuning step size. below this is the tuning dial. below the dial is a tiny lever that control how easily it will turn.

the right section contains an upper section with a keypad and lower section of other buttons. the keypad is arranged in four rows of three buttons. the first row contains one, two, and three. the second row contains four, five, and six. the third row contains seven, eight, and nine. the fourth row contains the decimal point, zero, and an enter button.

below this keypad are buttons in three rows. the first row has three buttons consisting of vfo or memory mode select, memory write, and clear. the second row as two buttons: one for selection and one for scanning. the third row has two buttons: one for down and one for up. below all these is a very small button that allows you to lock the display so that bumping the tuning knob will not cause problems.

underneath the unit is a tilt bail. i will now describe the rear of the unit from left to right. first there are two eighth inch jacks

one for a recorder remote and the other for recorder output. then there is an RS232 control followed by two more eighth inch jacks. one jack is for a CIV remote control and the other is for external mono speaker output. next is an RCA type mute control jack followed by a push type connector terminal with inputs for both ground and antenna inputs. this can be used for random wire antennas. to the right of this is the DC power input connector. above this connector is an SO-239 antenna terminal. this is for coaxial type antennas.

if you need more descriptions just ask.

regards,
phil :)

The sync on the R8B is marvelous, but I think the audio is richer on the R8. I love the metal tuning knob on the R8. If you have never operated an R8 you should. It's real nice. It is simple to operate and effective. I am still amazed at how signals jump out at you.

As far as the soldering I haven't done much in years and have done zero surface mount. I already read of one near catastrophe with soldering in an R75. If I was confident I'd buy a new R75, but that's why I'm looking for a nice one already done.

Your help is appreciated!

experience?

> The problem with the R75 is the AM audio

i could not agree more. DeWayne do the AM-AGC, Sync-AM, AND fidelity
mods. make sure to read my surface-mount soldering course PDF in the
files section if you do them yourself.

the following wav demonstrates the fidelity mod using 15 kHz filters.
DSP NR is engaged for ~4200 Hz fidelity... at 10 seconds it is turned
off, yielding ~6200 Hz fidelity.

Phil,
But don't that degrade the audio even more? I mostly SWL and am interested in voice.
Being an old fart, when I switch to Narrow filters, I can't understand what the folks are saying.

Thanks for all the "Phidelity" phun Phil. Project is slated for this weekend.

Just wondering if you could post the audio file in the list area as it seems your server is timing/dropping out due to demand. I'm getting a transfer rate of less than 200b/s and have yet to get the whole file.

Thanks again and best for a great Thanksgiving (at least a Redskins victory!).

Regards,
Bill Dean

Is there a mod to bypass the attenuation below 1.6 mhz? After doing this mod, will you get front end overload?
What's envolved with doing the sync mods. Being blind, I would have to find someone to do them?
I downloaded the owners and the cookbook from the files section to get more info on the r75. The cookbook is not at all readable with my speech accessable version of the acrobat reader. The owners manual is somewhat readable. It's going to take some editing to make it readable.

From: "just_rtfm" <just_rtfm@...>
> the R75 manual is WRONG. it states that &H18 &H00 will turn the radio

There were a lot of things that were wrong in that manual. The part with the memories (especially the memory text) drove me nuts. There was nothing about that whole setup that was right, and I had to figure it out trial and error. Keep in mind that the whole development was done over ICQ with Tom Sundstrom - he would test, provide results, I would recode and FTP the exe to him. After that was done, I decided never to do another control thing in the blind like that. The Lowe and the 545 addition were done like that too. Too hard to do.

I remember that we scratched heads on the power thing until it hit me that 1 = on, 0 = off, as conventional wisdom would dictate. I decided to leave the power switch in there, but it really acts like a standby in my program. Like the JRCs the ICOMs really prefer that the radio's on before sending any commands. Otherwise it's pot luck - there's no guarantee that anything will return right from a cold start. However, I'm able to detect if the radio's on or off from the get-go. BTW: I also use a delay after toggling the power switch, but only 1 seconds worth to allow for settling.

> IMO your software is the best control program for the R75.

Thanks... Now I just gotta get all that mess integrated into v4...

hi Bill:

> But don't that degrade the audio even more?

it can somewhat but remember you only need half the AM signal so detuning a 2.4 kHz filter is like having a "4.8" kHz AM filter that covers both sidebands... so the sound is actually pretty good once you detune or turn the PBT all the way left or right... try it! then find a station with one-sided interference and try it again... the resulting audio may surprise you.

regards,
phil :)

This comparison is not quite correct. When you engage the DPS NR you also get some distortion! If you look at a spectrum display you will se the amplitude versus frequency curve is not flat when NR is in use.

ERGO installed just fine under Windows XP (Home edition) on my machine.

More info from the Windows XP page at the ERGO site:

"On February 15th, we installed Windows XP Professional on a test machine.
Ergo 3 was downloaded
and installed, and ran without difficulty using the R8B on Com2. DSI
imported the ILGRadio data and
linked with the main program, as shown below.
Ergo 4 Beta was downloaded and installed, and ran without difficulty using
the R8B and AR7030. The
ILGRadio data was imported without issue. We also tested the Propagation
and Progam Update
functions, which worked."

If you're having trouble, have you contacted John Fallows the author? He's
usually very prompt to assist with issues.

I have used
Mark J fines Smart r75 adn ergo with xp pro and had no trouble at all!

both work fine. Ergo is a magnificent piece of software with its importing
of skeds and propgation forcasting ability. The version I tested didnt have
the IC-R75 control module, so icant coment on that.

Similarly the Demo verison of Mark Fines s/ware doesnt allow you to update
the HFCC so teh sked is only half useful.
but as i say they are both fantastic and work well with both xp and 2000.
this week i have just installed Robert Silletts FREE SWlog software.
This is also a very very very good program for a powerful PC

Howdy,

I have an R-75 and enjoy it very much. My problem is when I turn on my computer, it
is like turning on jamming equipment. I have installed RF chokes with limited success.
My question is, has anyone had success with a commercial built computer that causes
little or no interference? Or a good homebuilt system that works well for them. My setup
is with a Pentium 3 @ 750mhz on an Intel board. I would love to see how the R-75 works
with computer control.

Thank you in advance for any help,

Jim in Sacramento

Hi,

first check if the origin of the noise is your computer or your monitor (swich off the monitor with computer on and listen to your R-75). If it is the monitor, you can try to change the screen refresh rate to a lower (or higher) frequency. Sometimes it works. Check the ground connection of your computer either.

My homebuilt is pretty good. It's in an ATX case which has good RF seals and I have a number of ferrite beads on various cables coming out of it. A couple of builds ago I was using AT style cases and had many problems with RFI.

hi Bill:

> I did try it on 12095 w/RTTY on the USB

you would want to tune to ~12093.8 with both 2.4 kHz filters
engaged... also make sure that SAM is engaged. i too have had
occasions where it does not work as well as SSB... i have been
meaning to do more experimenting with it using a spectrum analyzer.
whether the filter will be effective depends on the distance the RTTY
is from the carrier (how far out on the filter attenuation curve it
resides) and its amplitude relative to the station's carrier.

regards,
phil :)

Check the power supply in the computer! Make sure it is FCC type B certified. My brother bought a computer with a power supply that was not FCC type B certified and the interference wiped out everything from the am broadcast band up! After buying a new power supply that was FCC type B certified the noise went away.

From: just_rtfm
Topic: 3027 Message: 3073

hi Gert:

> This comparison is not quite correct.

you are *absolutely* correct (as usual Gert). the recording is not a before and after. the recording was made to show the frequency response after modification with and without NR. it is not comparable to a before-mod and after-mod at all... you will notice significantly more highs even with the NR engaged after modification (aka first 10 secs of the recording). the mod makes the sound with NR-engaged more pleasant.

to make a direct comparison of before/after i would have wanted to broadcast my own high fidelity transmission (twice) and hook/unhook the wires... i considered it but this would be much work.

what you could do though is run this recording through a spectrum analyzer... then try the same on the output of your own unit's REC out using some music... you'll see the difference. make sure to record at a rate of 11k/s or higher to make sure the analyzer can "see" up to 5500 Hz+ of output response. the "quick and dirty" comparison is to listen carefully to the recording. i never heard highs in songs like that until after the mod. i can also tell the difference now between the 15/15 and 15/6 filters.

it's not all peaches: if you do mostly SSB work you will find yourself tweeking the twin-PBTs more as you cannot rely on the 3 kHz audio filters to do what the IF filters should... fairly small learning curve. you will also notice more high-pitched signal but also more high-pitched noise. some people may want to use the 100k-ohm resistors instead or even add a switch (both mentioned in the PDF). feeding the output into an amplified speaker with tone controls works very nicely.

regards,
phil :)

Hi Phil,

Thanks, that will help. By any chance, do you know anyone who would be willing to edit the text version of the r75 manual? My speech accessable version of Acrobat reader will allow me to export the manual to text form. I did this and the r75 manual I downloaded from the files section was not very readable.

> Turn both knobs? or just one?

i almost always detune; however, my guess is that you need to move
both knobs under AM... but under SAM only the outer (9 MHz IF) knob
needs to be moved. you can definitely tell it is working as the audio
brightens as the bandwidth changes from 1200 Hz (aka half the filter
for each side straddling the carrier) to 2400 Hz.

regards,
phil :)

I agree with Russ on the power supply noise. I tell people on a daily basis that you get what you pay for with computer equipment/parts. Cheap power supply = noise and limited lifespan. Cheap case = RF leakage(avoid the fancy plexiglas windowed models).

I had on old 17" monitor that worked great but also generated all kinds of spurious RF at all but the very lowest resolutions. This thing would produce a nice 60 cycle hum in a guitar pickup from 20+ feet away!

Good grounding, chokes on the serial cables and getting rid of that monitor got rid of 90% of the noise on my PCR1000. Santa should be delivering my spanky new R75 soon and I can't wait to see how it compares to the PCR1000 and my Icom HF rigs.

3078. Preselector/Tuner For Sale

Yahoo group: icomr75 (2000 — 2002)
Date: 2002-11-29 15:46:49 UTC
From: Moxie3
Topic: 3078 Message: 3078

I decided to sell my Mizuho AT-2000 passive antenna coupler (referred to by some as a preselector/tuner) which took an inordinate amount of time and effort to purchase. I just don't see much difference with using a tuner for the shortwave stations I've been receiving. You have to understand that I'm very satisfied with my R-75 without any of the mods, albeit I don't understand much of what has been discussed the last few weeks. It has less than a total of 1 hour of use, no scratches or blemishes of any kind, in new condition, immaculate; with original box and packaging and owner's manual. I would like to get my money back on it; paid $127 from a German company . Add $5 for UPS shipping anywhere within the U.S. or Canada. If you live in the Tampa area, you are welcome to try it out. At the present time, it is being used as an ornament sitting authoritatively on top of my R-75. If you have any questions, feel free to e-mail me at moxie3@...

hi everyone:

first, i have uploaded a file for Pete Gianakopoulos' Advanced MW Attenuator Bypass Mod. it includes Pete's text plus a color coded schematic and a matching PCB picture. i have not done the mod but have been asked numerous times for help. as such i do not have an "after" shot... if you have one it would be much appreciated!

Pete Gianakopoulos' MW Attenuator Bypass Mod:

http://groups.yahoo.com/group/icomr75/files/Phil%27s%20Shack/PeteGMod.pdf

secondly, i have uploaded a corrected version of my 3 kHz murata filter modification. thank you Enrique for pointing out the error.

Phil's $19 AM Filter Mod:

http://groups.yahoo.com/group/icomr75/files/Phil%27s%20Shack/%20Philter.pdf

lastly, if anyone has used R1254 to set the UT-102 voice synthesizer's volume please write back so a brief PDF for this can also be uploaded. thank you.

regards,
phil :)

3081. R75 assistance needed

Greetings, I'm blind. I exported the owners manual to text form from the pdf version I downloaded. I'm wondering if someone would be kind enough to look it over, edit parts of it to make it more understandable with speech. I noticed there are a lot of illustrations in the manual! They are hard to understand with speech.

Russ

3082. Just did Phil's $19 AM Filter Mod Ver 2.0

Well, I ordered the $7 filters about 10 days ago, then I saw the discussion over the orientation of the filter. I was in no hurry so I sat back & watched the posts & waited for the dust to settle. Then I saw Version 2.0 when I last checked the file so I knew it was time to proceed. Very easy mod & I am more than pleased with my new "normal" filter selection with the new filter. I love this radio!

i am greatful to Enrique for pointing out the error. these mods are new to the board but Ken and i have had them in our radios for many months. i never noticed that i put my filter in backwards! i would agree with Rado that "releasing" a mod is not an easy task. personally i would rather people (like Enrique) scrutinize them.

> Very easy mod & I am more than pleased with my new "normal"

i am happy to hear you are pleased with the filter. IMO the filter has a good sound... better than its 3 kHz bandwidth at -6 dB suggests. it has excellent rejection at -80 dB. if you look at the Murata catalog this filter is the tightest 15-element filter they make... and 15-elements AFAIK is as high as they go.

regards,
phil :)

Hello,

First, I must thank everyone in this group for all the great info posted here. I spent the last 4 days reading ALL the posts that I thought would be helpful to me.

Now with that said, I just received my r75 tonight!

All I can say is WOW! Just spent the past 3 hours learning how to drive this rig, and so far I'm really impressed. Installed the DSP (came in the same box-thought I'd have to wait).

I am sure that I wouldn't have been able to setup and enjoy this radio so quickly without being armed with all the info from here.

Thks again everyone.

Rich

Welcome to the group Rich.
Your excitement has brought me back to the first few days of that new radio smell wafting from the freshly opened ICOM box, permeating the air with the suptle smell of gentle component break in.....
I agree with the other Phil, take your time with the radio and print out things like Phil's Cookbook and other files and messages that you might want to refer to. I have a file with all my 75 material including the sales slip.....(only about 300 bucks more than what they are going for now....damn...).
I got used to the radio and then determined which modifications I wanted to have done.
In those days KIWA was right down the street so that spoiled me greatly.
I worked extensively with antennas and ground systems first, trying to hear everything I could.
I was very happy with the set right out of the box, but my love for the radio moved me to make it better as I could.
I have accumulated a few more radios in the mean time, but the 75 is used EVERY DAY.
My wife still claims it is possible to have a love affair with an ICOM...hahaha.
I can see it in the tabloids now.."MANS AFFAIR WITH IC-R75 IS FIRST EXAMPLE OF HOMO-RADIO COUPLING" Haahhahaha.
Again, welcome to the group.
Phil

I guess everything is relative but I'm more than satisfied with the number of stations I receive, and I'm not at all serious about receiving those faint stations. A different radio? From what research I did, anything for less money usually results in a portable style; these are usually throw-away types as repair is so expensive. I've been that route and for a few extra bucks, you get a fine radio and,if need be, easily repaired. The R-75 is my first quality shortwave radio and it has exceeded all my expectations. Good luck in your decision.
George

I'm blind and have been doing a lot of research on the R75. It looks like a great value at this time. I see it advertized for $549.95 with a free UT-106! all of the reviews I've had read to me from Passport to World Band Radio and The World radio TV handbook give this receiver a high rating. All I have to do is, buy the UT-102 speech synthesizer. I used to own an Icom IC751A in the past and it was great being able to tune the bands and know what frequency I was listening too! Currently I'm using a Grundig Satellit 800.

IMO there will always be interesting things on shortwave: news, talk radio, sports, religious, music, ham, aviation, maritime, fixed, beacons, pirates, numbers stations, clandestine, RTTY, SSTV, CW, BPSK-31, etc.

on MW alone there is so much to listen to... all you need is a good MW antenna and your trusty R75.

regards,
phil :)

From: John M. Gedde
Topic: 3089 Message: 3093

Sounds like a good thing for Dxers... The heavy hitters with their 500 kW tranmitters blasting away the good DX would be a welcome thing to get rid of. At least to me...

IMHO, Shortwave certainly won't go away for those in third world countries where satallite radio is not affordable... For those living in the boondocks, shortwave may be the only option.

I'd be really happy if certain US broadcasters would transmit inside the standard bands and get out of the band edges and tropical bands where they trash DX....

I would assume that most on this board would agree with me, else they wouldn't have purchased a stunning radio like the R75... A portable with a whip antenna is good enough to listen to most Euro broadcasters...

Cheers,
John

3094. R75, Trying to decide!

Date: 2002-12-05 16:51:45 UTC
From: Russ Kiehne
Topic: 3094 Message: 3094

Greetings, I'm blind. I'm still trying to decide if I should buy
the r75? It seems to be a great value at this point in time for $549.95
including a free UT-106. I would especially enjoy having the optional
UT-102 speech option.

How does the r75 preform without the Kiwa and or equivalent mods?
I would not want to take the chance of doing any mods until the warranty
period has run it's course.

At present I'm using a Grundig Satellit 800. The sync will out do the sync
in an unmodified r75. The sync doesn't lose lock and I have sideband
selectable sync. I know you can use ecss tuning in am mode and get good
results. Personally, it would have been more practical to have sideband
selectable sync on the r75. Why Icom
didn't do this, is beyond me!

I'm beginning to see what Gerry means in the following
http://www.dx-tools.com/BestDXrx.htm

I'm familiar with most of these and they are good performers on MW.
I've been asked why no ICOMs appear in the rankings (the R-70 now appears).
This is based primarily on my personal experience in side-by-side tests with
other radios.
I own, or have ready access to, the ICOM R-70 (heavily modified), R-71A
(with upgrades) and an R-9000 (stock). All are absolutely superb for
utility DX (my second passion) and ham use.
Unfortunately (for us) , it has historically been the case that ICOM
apparently designs for the amateur radio market (and SSB performance) and
not for the SWL/MW DX market. This shows in
side-by-side tests with other manufacturer's radios. I used an R-70 for
years for MW DX until I compared it side-by-side with radios by Drake and
JRC and immediately saw the difference, especially in weak signal
sensitivity on MW. In fact, I've never
been impressed with the sensitivity of quadruple conversion radios and have
had the greatest DX success with single- and double-conversion
units. (It seems to me that at some stage of multiple conversion, the weaker
"difference" signal is going to fall below the post-conversions amps' noise
floors unless very careful steps in design are taken...just a thought.)

3095. Where shall I buy R-75?

Yahoo group: icomr75 (2000 — 2002)

Universal Radio seems to get the nod. Universal seems to have an impeccable rep, but I wish the return period(14 days) was longer. They have cut the price via Holiday Coupon another $50 for a final price of $550. I plan on getting 3 mods from Kiwa (inter. bwidth, sync detector upgrade, and fidelity upgrade) for approx $200 more.

Can anyone warn me of any trap doors I might be falling into?

Also, I plan to get the following options:

CI-V Level Converter connection to a PC RS-232C port.$ 119.95
MB-23 Carry handle. $ 10.95
DC fused Power cable for 12 VDC operation. $ 19.95
UT-102 Voice Synthesizer $ 54.95
UT-106 DSP unit free, for now

I'm a little concerned about the CI-V Level Converter for PC connection. $120 seems a bit much. Does it work OK? Will I need extra cables?
I've already downloaded the RLDB/Fineware software. Looks great, but I wonder how much of the radio I can control with this program? I primarily wish to click on frequencies in RLDB program to change stations. Am I mistaken on this?

Great group we have here...I'm really impressed by your collective diligence and technical saavy.

Thanks,
Carl

Check strongsignals.net, dealer FAQ's. They have a list of Icom dealers. Email each one an ask their best price including shipping. Make sure you check Gigaparts.com. It is not rare to pick up an R75 for $500 or maybe less. A few years ago I did this on a new radio and out of ten dealers eight of them wanted $500 but two $450. So I saved $50 real easy. Do a little shopping. That's a real neat thing about email. All it costs is a little time. Don't forget to ask their return policies.

Hi Carl-

Actually the $50 "instant coupon" is ICOM's doing so you should be able to get the savings through any ICOM dealer. I recently purchased a R-75 from HRO for $498. The UT-106 was included at no cost and the "instant coupon" was simply treated as an in-store rebate, nothing to fill out and no waiting for the check to arrive.

You don't need the CI-V converter for direct control of the R-75 with the Fineware control package. A simple straight through RS-232 cable between the radio and your PC will do the trick. That's assuming you only want to control the R-75 of course- a more complex setup may indeed require the CI-V but I think you might want to hold off on that to see if your needs are met.

Good luck!

Bill Dean

3098. Macintosh Software for ICOM R75 Available

Yahoo group: icomr75 (2000 — 2002)
Date: 2002-12-05 18:32:45 UTC
From: vr500pjh
Topic: 3098 Message: 3098

FYI

Macintosh software is now available for the ICOM R75.

Versions are available for Classic Macs (8.1 - 9.x)
and for OS X.

Requires a CI-V type interface and usb Macs also need
a USB-to-Serial converter.

Demos can be downloaded for testing before purchasing.

See http://www.experbyte.com/macr75 for more details.

Regards,

PH

It's also completely unneeded. Your R75 comes with an
RS-232C port, all you need to connect it to your PC is
a serial cable.

Rik

Russ,

I'll reiterate what others have said. The R75 is so stable that selecting a sideband and using the 1 hertz tuning -- which is rarely necessary -- you will be pleased. You won't miss the AM synch on the Grundig very much. I have the Grundig too as you may recall. I have no mods to my R75 except the UT-106 and I am very pleased. I do use an MFJ-956 passive antenna tuner and that is useful. I also pipe the audio through my Harmon Kardon receiver for much, much, better audio than from the R75 stock speaker.

I use Fineware Smart Icom software to control most aspects of the R75. I don't know if you could use this since I don't know if Microsoft Narrator works with it (or even know how to set it up to check it for that matter!).

Bottom line: you will enjoy the R75.

Gordon

Carl,

One minor item you need to watch for is with the optional carry strap : Make sure that the little metal screws they send with it have a slight taper at the tip so that they can be "started" into the holes in the case. Mine didn't (wrong screws sent with the option package - flat tip), and as a result, my attempts to set the screw into the case didn't work. They are metal screws that have to set their own threads. The holes in the case are not threaded. Luckily for me I live in Seattle so I drove over to Bellevue to the repair facility and they ended up changing the entire case and putting in the correct screws for me. This small check can save you a big irritation.

Personally, I feel the CT-17 is quite pricey! I found the following on the CT-17 on the Radio netherlands site:

For receiver control, this ICOM has a DB9 (RS-232C) connector and a connector for the ICOM standard CT-17 CI-V level converter. If you are not controlling
multiple ICOM receivers or transceivers, then you do not need to purchase the expensive level converter.

When is it gonna be upgraded to work like the TK-2 and TK-92, in that
the memories can be changed from within the sofware.

To Bob: I am willing to be a "beta-tester" for all 3 softwares
I do own a R-75 R-2 and Pro-92

I opened up a CT-17 -- necessary for an ICOM R-7100 -- and IIRC there's
only one active component in it: A MAX232 RS-232 driver chip.

At least the Yaesu CAT driver boxes include optoisolators...

Correct. All you need is a DB-15 serial cable (sometimes called a monitor cable), about $5, depending on length. Works great. I think I've also seen plans somewhere for making a converter for about $5 worth of parts.

I have the Cambridge multimedia speakers I can use with the r75. I've used them with my Dx-398 on fm and wow what great sound. I'll probably end up using my Grundig for my Mw listening.

is Fineware Smart Icom software free? I wonder if I can try it without having the r75 hooked up. This way, I'll know if I can use it before I get the r75.
I don't use Windows XP. I use Windows 98 SE. My screen reader is Window Eyes.

hello Carl:

for inexpensive PC control forget the CI-V. pick up a $14 RS232C
cable at Radio Shack. not all cables are the same (you do not want a
null modem cable). the part number you want should be #26-117B.

regards,
phil :)

Hi, all!

I've got my R75 just yesterday! It is really amazing receiver! I bought it on eBay so I don't care about voiding warranty and can do any mods :)

Cheers,
Alex

"I'd be really happy if certain US broadcasters
would transmit inside the standard bands and
get out of the band edges and tropical bands
where they trash DX..."

Hi John,

What USA broadcasters might these be?

Myself, I didn't buy the IC-R75 for DX.
I just wanted to maintain that wonderful
1Hz tuning for BCL like I have with my half
dead R71A.

Got my R75 in 5/2000. As far as any mods:
I'll wait until I get a new computer system
so I can read the PDFs that I can't do now.
(Unless there are HTML or TXT mods in the file area.)

I've been a friend of the owner since 1985, and was in touch with him just before he moved his business to Minnesota. It was going to take at least two U-Haul trips from Washington State to get all his company's stuff over there. Also, he had house hunting in two different cities to investigate. Craig is pursuing other business interests besides KIWA (it had been his only occupation for quite some time). He's had some lengthy contract work outside the USA back in the summer; I wouldn't be surprised if the same organization has sent him out of the US again for a time. Unfortunately, I've had no contact with him since mid-September. He fully intends to get KIWA up and running again (unless something's changed lately). I do know that some of his products and services were going to be discontinued :^(

You can try it for 60 days at no charge, then you're expected to
register it for $60.

I unhooked the serial cable from my R75 and then opened Smart Icom. You
are limited, with no radio connected, to accessing the various
databases. That might give you an idea of how it sounds with Window
Eyes.

Russ,

Here's the link you need: http://www.fineware-swl.com/sic.html

The download link is about three quarters down the page and says:
<http://www.fineware-swl.com/downloads/siw32_32.zip> Smart Icom Control
32 v3.24e

I can send it to you off group is you like. It's 1.645 Megabytes
zipped.

Gordon

Hi Russ-

I've been meaning to try TK75 from Robert Parnass but haven't had the time this week. It looks interesting and supports remote control of squelch and PBT- very handy for my needs. Have a look at:

http://www.parnass.org/tk75/

don't need all of these options the program you told me about does.
==========

Russ

Since you are sight challenged, Id be willing to send you a copy of
Icoms own software appropriately called R - 75. I use it on mine and
it works very well. It shows a virtual receiver front with all the controls
and you can direct enter things from there or there is a frequency sweep
mode where you enter a lower and upper frequency and it will scan and
visually show the noise floor and the signals themselves. It also has memory
bank where you can store whatever frequencies you want ,, 100 per page
and I'm up to my 5th page now with about 400 and some stored frequencies.
It also has a bandscope feature that will show activity between 2 frequencies.
Its a fairly simple program to work. But I dont belive it will work without
the radio connected. I dont know of too many programs that will. If you'd
like a copy, send me an email offgroup and we'll talk. I'm only making this
offer to someone who has a handicap.

Dr. Phil,
I have gotten all of my stuff together for the HiFi mod. Antex Iron, 47k resistors, silver bearing solder...

I decided to give the .pdf one more close reading before proceeding so I took it to bed with me. I ran across a sentence that bothers me. Paraphrasing, it seems to say that the mod only affects audio output if the DSP is disengaged. The rub is that I find the audio satisfactory with the DSP off. It's only with it engaged that I find the sound mushy.

Am I interpreting the paper correctly?

3124. R75, Trying to decide! Software Control Programs

Yahoo group: icomr75 (2000 — 2002)
Date: 2002-12-06 21:45:11 UTC
From: Ed Pusey
Topic: 3094 Message: 3124

Friends:

I've been using Tk-75 for months now, and it is absolutely superb. I find its greatest utility is creating multiple frequency files by type & having near instant access & upload capability, not to mention what seems like 100% control over all R-75 features, superb scan up/down, etc.

I also use Fineware's Smart Icom Control 32, it too is first-class.

I would add that both developers are truly helpful. Mark provided me instant feedback when I had a question on updates sometime back, and Bob even explained to me how to write a batch file to allow Tk-75 to run under Windows XP.

I think the correct answer is to have both programs - you can't go wrong.

Ed Pusey

Hi Russ-

I've been meaning to try TK75 from Robert Parnass but haven't had the time this week. It looks interesting and supports remote control of squelch and PBT- very handy for my needs. Have a look at:

http://www.parnass.org/tk75/

Regards,
Bill Dean

I downloaded it without any problems. I read the info on it and it sounds
like a great program. It does more than I need. I would like to find a
program that would allow me to set up the different options in the radio. I

don't need all of these options the program you told me about does.

OK, I'm going to purchase one of these receivers.

I've read most of the glorious reviews for both.

Seems that most people like the one they chose.

What I would like, are opinions from people who have, or
have operated both for a time, as to which one they like for Utility
listening. Not interested in broadcast band stuff. Strictly from
a Utility perspective.

Thanks to Nick and Russ,

The power supply was changed out and 99 % of the QRM is gone.
Now I can listen and compute at the same time.
And for the first time, use the computer controlling software.

Thanks again,

Jim

To: hfmilcom@yahoogroups.com
Subject: Re: [hfmilcom] Computer noise

I had a similar problem with my FRG7700. Because I do some data decoding it
needs to be fairly close to the PC and connected to it... Big noise.

There are two things I've found which help. The first and most dramatic
improvement was caused by getting the receiver above the PC. In my case the
PC system unit went on the floor and the 7700 stayed on the desk....
Drastic reduction in noise.
The second is to be aware that much of the QRM comes from your monitor. If
a specific frequency or band that you're trying to listen to is noisy, try
adjusting your monitor refresh rate and/or resolution setting (always adjust
refresh rate downwards, too high can be damaging) It's a bit of a pain but
it works.
I still get some noise, particularly from my cable modem but 99.9% of
frequencies are workable.

Hope This Helps.

Howdy,

I have an R-75 and enjoy it very much. My problem is when I turn on my
computer, it
is like turning on jamming equipment. I have installed RF chokes with
limited success.
My question is, has anyone had success with a commercial built computer

that
causes
little or no interference? Or a good homebuilt system that works well for
them. My setup
is with a Pentium 3 @ 750mhz on an Intel board. I would love to see how
the
R-75 works
with computer control.

Thank you in advance for any help,

Jim in Sacramento

3130. need help with mod info

Yahoo group: icomr75 (2000 — 2002)
Date: 2002-12-07 01:54:07 UTC
From: bobinhoser <bobinhoser@yahoo.com>
Topic: 3130 Message: 3130

hi all. i decided i only want two mods for now, i think the sync am thing is a lost cause without designing a completely new one, my opinion only. one is the audio freq response improvement, the other is a simple(i hope) way to slow down the agc release time, its way to fast for me, fluttery am signals really pump it, hopefully i can parallel a cap across the one that determines decay time. point me in the right direction if you can. i think the audio one just involved some resistors.this radio is just great FUN to operate. my fully loaded kenwood r5000 is off to Ebay. thanks to all..have a nice weekend BOB.....

Topic: 3094 Message: 3131

howdy Bill:

the mod effects audio both with and without the DSP engaged. if you feel the audio is satisfactory with the DSP off then i would not do the mod. the upside to the mod is more high frequency sound... the downside, there can be more high frequency noise.

about an hour ago i found some 90k-ohm resistors and was curious so i removed my 47k-ohm ones and gave the 90's a try. i noticed a drop in fidelity and can no longer tell the difference between 15/15 and 15/6... i'll post more specific data in the future.

my advice: if you like the audio the way it is do not change it. if you want to try the mod use wire-wrap and leave the leads long so you can add a switch or try another set of resistors. by using wire-wrap the mod is very non-permenant... you can remove it in under a minute using scissors.

regards,
phil :)

hi Randy:

i realize now that you're trying to decide between the RX-350 and the R75 for utility work. i do not own both and suspect not many do. ICOM and TenTec are big names in amateur and both radios boast 1 Hz tuning steps and triple conversion.

here are some important distinctions: the RX-350 has 1024 memories whereas the R75 has only 100 (PC hookup may make this point moot). the RX-350 has a bandscope... there are probably PC bandscopes for either. the RX-350 has 34 DSP bandwidths; however, the R75's twin PBTs can be turned in opposite directions to variably narrow the bandpass from ~2400 Hz to ~400 Hz.

physically the RX-350 is much bigger than the R75. the R75 boasts extra coverage to 60 MHz, is more sensitive, has better IP3, and allows for optional (mechanical, crystal, or ceramic) filters [for better ultimate rejection, IMO this is important]. the RX-350 does not come with a keypad, apparently has BCB images in LW, and some have complained about display ghosting and granularity.

you can pick up an R75 for $530... less than half the cost of an RX-350. Passport calls the R75: "a first-rate receiver for unearthing tough utility and ham signals". WRTH gave the R75 five stars for overall value. i have never heard of anyone buying an R75 for utility work and being displeased. get the proper antenna for whatever you're after and you're set!

regards,
phil :)

hi Russ:

what will be your main usage for the radio? are you planning on keeping your Satellit 800? what type antenna will you use? you should be aware of the AM flaws in the radio before you purchase. without the mods you may use ECSS for most AM stations whereby you tune them using single sideband. single sideband offers no selective fading and great adjacent channel rejection. for what it is worth you can select a sideband on AM via the narrow filters and passband tuning.

my main usage is medium wave so let me play devils advocate and tell the other side of the story with with regard to Gerry's comments. he is correct regarding the stock unit's AM performance but has he done side by side testing with a modified R75? some who frequent this board have. JRC's unit is three times the cost of a modified ICOM. the medium wave weak signal sensitivity he speaks of being worse on the ICOM is due to an internal 10 dB attenutator. what strikes me as odd about his comment is that Gerry makes MW antennas... EXCELLENT MW antennas that employ 40 dB of gain. his antennas totally negate the 10 dB of attenuation that ICOM uses. his idea that triple conversion is inferior sensitivity-wise is in my opinion unfounded. it just so happens that ICOM uses triple conversion and an attenuator. checking the specs you will find that on shortwave the R75 is one of the most sensitive receivers. lastly, while it is true that each mixer adds harmonic distortions this trick is used by ICOM on purpose to add to intellligibility. ICOM is not a leader in amateur radio for nothing.

regards,
phil :)

Hi Phil,

I plan on keeping my Satellit 800. It has such great sound! I'll probably use it for my mw listening. AT present, I use a 27 inch loop I inductively couple to the Satellit 800 with very good results. Later i would like to get a Quantom loop. I also have a small pickup loop I can hook to the R75 to inductively couple my large loop too.

I'll use the r75 for listening to shortwave and the ham bands. I enjoy listening to the 40 meter swap net on Saturday and Sunday afternoons. I have a long wire I use for hf listening.
I was wondering, why did Icom put in attenuation in the r75 for mw and lw? After doing the mod to remove this attenuation, will you get front end overload?
At present, the r75 seems to be the only receiver with a voice synthesizer option. From the number of reviews I've read on the internet, friends have read to me over the phone, the r75 is a great vaule!

Russ

No,I did the MW attenuator mod and I,m not getting any overload in MW.Check in files for the Attenuatr mod parts.You will need one 1mh inductor and one SF 100 ohms resistor.

hi Russ:

here is another perspective. if you plan on keeping your Satellit 800 then the stock R75 will be a great second radio. you may even opt not to do any of the AM mods on your R75. i am unsure why ICOM used a MW attenuator in the R75. i did read that Pete, the creator of the attenuator bypass mod, lives within four miles of three 50 thousand watt stations and experiences no overload.

the R75 and Quantum loop are a potent combo for medium wave reception. because of attenuation the Satellit 800 is about three times as sensitive as the R75 on medium wave but Gerry's awesome loop provides 40 dB of gain. this is a gain of ten thousand and it is more than enough with or without the R75 being modified. on medium wave the antenna is everything whether it be a beverage, K9AY loop, or amplified indoor loop. medium wave has so much to offer.

on shortwave the R75 is very sensitive and ham reception is excellent especially using the DSP. some people do not like the DSP but in my opinion it is a real blessing for your ears while tuning. by the way, if you cannot read my R75 cookbook i will gladly mail you a text version.

regards,
phil :)

Hi Phil,

I downloaded the r75 cookbook and it seems to be all illustrations! It's not readable. I would like to have it in text form.

Here in the San Francisco bay area, we have 5 50000 wat stations and another coming next year!

I want the r75 because of having the DSP, noice blanker, notch filter, passband tuning and especially the voice synthesizer. The Satellit 800 has none of these. After having the IC751A in the past with a voice synthesizer, i miss this option!

Do you use the Quantum loop?
Have you used the Kiwa air core loop?

Russ

Yesterday I did phidelity, AGC and SAM rev1.1 mods. Results are quite impressive! Next weekend I am planning to do SAM rev2.0 and MW attenuator mods. My R75 becomes better and better! :)
What I really need now is good antenna. I ordered all staff for it (longwire) from R&L but they have no ICE 182A in stock and I am waiting month already while they are trying to back order it.

Atagrasin - do you live near any high power AM stations?

Without the mod, and even with a PAR high-pass filter, I get three
stations doing their image/intermod thing. It may not be either the radio
or the antennae, but I'd hate to do anything that'd make it worse.

Me, too - this place is RF rich. I live right on the Bay Plain, and a
couple of those transmitters with salt water grounds sound like they're in
my kitchen!

Wow! So far away! I thought that they are inside my R75 :)

3150. Type of serial cable needed to connect an R-75 to a computer?

Yahoo group: icomr75 (2000 — 2002)
Date: 2002-12-08 20:46:52 UTC
From: Derrik Walker v2.0
Topic: 3150 Message: 3150

Is the R-75 seen as a DCE or DTE?

In other words, do I use a Null Modem cable, or a straight through
cable to connect the R-75 to a computer?

Thanks.

HI amatveev1:Welcome to the "frankenstein juniors family".Now you
know by first hand experience what the upgrades[mods]are all
about.Murata have the 1MH inductor that you need for the MW
attenuator mod.For the [SF] 100 ohms check a broken car radio.Any
question about the Sync det mod and the MW mod you can E-mail me.
With best regards:Atagrasin.

Just yesterday I bought RS232C cable at RadioShack (part #24-117B)
for $13.99. It works just fine with my R75. It is a straight through
(pin to pin) extension cable not null modem.

Thank you for advices! I will break my car radio immediately :) Just
kidding!
BTW, what [SF] means? I don't know american electronic abbreviations
well, but you can ask me about russian ones :)

HI Alex:SF=surface mount resistor.Car radios and video recorders and
other comsumers electronic equipment use this kind of micro
resistors.If your car radio is broken [damage], not problem open it.

3158. R75 and goodies for sale.

Yahoo group: icomr75 (2000 — 2002)
Date: 2002-12-09 01:39:06 UTC
From: Marcus <signal74@optonline.net>
Topic: 3158 Message: 3158

Greetings folks,

Tonite I have my R75 for sale. It is 14 months young and in pristeen condition. 10 out of 10 cosmetically with no flaws whatsoever. It has Rado's 2.1 mods installed and operates nicely. It also has the UT-102 voice synthesizer installed and the UT-106 DSP unit installed. All work just fine.

Next is a nice mod I installed, its a remote main dial knob with the matching Icom dial knob thats on the radio. There is a switch on the rear that is down for the front panel knob and up for the remote knob. The remote knob is in a nice black box with weights inside to keep it from skidding off your table or chair. The remote box is on a 10 foot cord and plugs into the rear of the R75 with a nine pin connector, its a serial cable that I used. A nice addition that Icom should of thought of.
This mod is very neat and clean. Works just as neat too.

I used the identical rotary magnetic encoder that is behind the main tuning knob on the receiver. The encoder cost me $105.00 just for the part. The knob, box and cable was another 30 bucks. While I was ordering parts from Icom I also bought the service manual too thats included in the deal.

This is what you will get with the deal:
R75 with 2.1 Rado mods
UT-102 Voice Synthesizer
UT-106 DSP Unit
Remote main dial unit on 10 foot cord
Icom service manual, NOT A COPY.
Icom operating manual, original that came with radio
Icom power supply
original Icom box
boxes for DSP and voice unit

All this for $550.00 USD and 20 bucks for ship and insurance. Your choice of UPS or USPS.Payment must be a USPS money order ONLY. For your protection too.

Goodies will be packed tight and double boxed for our protection. Insurance is not negotiable.Total operating time is about 20 hours and sat on my night table the whole time, never installed or used in a vehicle.

Serious interested parties email me directly if you want pictures. I guarantee you will not be disappointed with this unit and stuff. I have an eBay feedback of around 34 I think with a few sales in

there, no dirtbags here,heh,heh....

Regards, Marcus

I don't think you are going to find much of this on the airwaves anymore. I was decoding it in the 80's with a PK232MBX but I believe it's being done thru satellite feeds now. Used to monitor some interesting SITOR traffic back then but haven't tried in 10 years. Someone, please correct me if I'm wrong...

Bob KB0XR Coon Rapids, MN

3167. warning! your 75 won't bounce..

A sad end to a good day. I loaded the car up, new phaser unit to try
out, mods done and all leads and longwires ready.
I'd found a new spot close to home, a bit of MW DX in my sights.
After about 2 hours of listening, the 75 perched with phaser on the
dash, I decided to swing one of the longwires around 90 degrees.
I thought the wire seemed a little loose towards the car!!!
there she was face down towards the floor, a sheared off AF vol.knob.
A quick look at home seemed to indicate a rather expensive job ahead.
Can a tech minded person tell me this isn't so.
Sob Lew.

3168. Now THIS is an Attenuator...

My recently aquired (used) R75 performed great with an 800-ft. beverage antenna last weekend at the WA coast. Beforehand, I had carefully performed the common R75 mods using some SMT equipment where I work, and all mods appeared to perform great.

All except the MW attenuator mod, that is! I discovered that mediumwave was a dead as a doornail compared to the same band on my AR7030. An S-9 signal on the AOR didn't even budge the S-meter on the R75! I hadn't used the ICOM on mediumwave before the DXpedition, as the rig arrived only days earlier.

The extreme attenuation is throughout MW, with no signals stronger than about S-1. Most were way down in the noise, and only the strongest signals could be noted at all. When the rig was tuned above 1600 kHz (might have been 1620) the radio "came alive"... performance and sensitivity was excellent all the way up through the shortwaves.

Back home after the DXpedition I put the R75's PCB under the stereo microscope again and looked for errors or solder bridges around the MW attenuator. No problems found! This was the "full" MW mod designed by Pete G.

Ideas, anyone? What is causing this extreme attenuation on mediumwave? Could a switching diode or relay be faulty in the bandbass filters?

hi. why dont you "demod" it back to stock, and see if it comes back to life. by the way, i keep hearing about "lack of sensitivity". gain distrubution is more important than sensitivity. if putting an antenna on the radio causes the s meter to move off the "pin" you have all the sensitivity you need. see ARRL handbook for more. I really hope you get it going again, BOB.....

HI Guy:Can you explain in detail what you did [including parts used]?.For me the mod was easy.I removed 2 resistors,and installed a 100 ohm [SF] resistor and a murata inductor[1mh].After the mod the MW band came alive[about.07 sensitivity].Very important=What service manual,schematic, diagram you used? the one online? or the one from Icom factory service?.For more help you can check with Pete itself.

hi. this whole AM agc thing has me confused. first, in normal
(non-sync) is the stereo decoder used as an envelope detector? is the
am agc self-contained in the chip or derived elsewhere? if in the
chip the "fast/normal agc switch would have no effect, right.
lastly, does the agc cap mod only effect the agc in the sync mode,
or normal and sync modes both? thanks BOB.....

Hi Bob,

I remembered after I posted my message that I *had* checked MW briefly when the radio was in its stock form, and that band did seem awfully quiet. I chalked it up to the MW attenuator, though, and didn't give it a second thought as I was going to be doing the mod. I'm sure I should have gotten a few S-units at least out of the local Seattle-Tacoma powerhouses (the stock R75 can't be that deaf on MW, can it??). I don't recall any signal on MW doing more than slightly bumping the S-meter. So, it really won't "come back to life".

Actually, gain on mediumwave is indeed important at the very quiet DXpedition location I've frequented the last 12 years. I DX for foreign trans-Pacific splits from the Pacific NW coast, and noise levels drop extremely low just past local sunrise in the winter. Our terminated beverage antennas are directed towards the South Pacific and Asia, and usually need a preamp such as the Kiwa unit or ARR preamp in-line. We've found that they give an "edge" in S/N ratio which helps us hear and ID the foreign stations between the stations.

A good case in point was this past weekend. Even though propagation was pretty dismal overall, a beacon station, 738 Papeete (Tahiti) was in at moderate levels throughout Saturday evening. When I switched in the ARR preamp, the signal remained somewhat intelligible a while longer as the deep, long fade troughs approached (characteristic fading of a distant trans-Pacific signal). The difference is not dramatic, but I and others who DXpedition at the WA coast have experienced the benefits of extra gain on mediumwave.

Extra gain is *not* beneficial, in my experience, anywhere but at a very quiet DX site with directional antennas. I'm sure a contributing factor is also the infrequent T-storms we have up here. The Pacific NW has the fewest "thunderstorm days" per year of any location in the USA, according to maps I've seen.

Here's an article by a friend of mine who comments on this same matter. In particular, see the "closing remarks":
http://members.aol.com/DXerCapeCod/kaztests.pdf

Before I put the R75 back to stock, I'm going to take a long hard look at the bandbass filtering section of the schematic and perhaps measure some components in my rig.

Thanks for your thoughts.

Hi,

I used Pete Gianakopoulos' modification, and the schematic PDF posted by user "Gurljo" in the Files section of this Yahoogroup.

The only substitutions I made were two small 500uH inductors in series, for a measured total of 0.950mH on my inductance-reading DMM. I also used a 1/8watt 100-ohm resistor for R174 (it measured 98 ohms) as I didn't have a SMD type. I did the mod while using a stereo microscope in my company's SMD rework area.

I double-checked my work before and after my recent DX trip to the Washington coast, and I cannot see anything amiss with the modification itself.

Looking back, I'm pretty sure the MW band was not working right *before* I did the mod. I received the radio only a couple days before doing the S-AM, fidelity, MW atten., and volume level mods. I had done only a quick cursory check of mediumwave, as most of my DXing is on the tropical bands. Even in its stock form the R75 should move the S-meter somewhat when tuning my semi-local 50kw powerhouses! Instead, they are weak voices buried in the noise. However, above the MW band the R75 hears as well or better than my AR7030.

hi Bob:

i'll give these a shot...

> first, in normal (non-sync) is the stereo decoder
> used as an envelope detector?

yes.

> is the am agc self-contained in the chip or derived elsewhere?

there is the main AGC and one onboard the chip.

> if in the chip the "fast/normal agc switch would have no effect

the main AGC is derived before the signal enters the chip. the
purpose of the capacitor (mod) is to slow down the chip's AGC so it
no longer over-rides that of the main AGC. ICOM appears to have
implemented the chip faithful to Motorola's PDF... unfortunately what
this was meant for was tuning through relatively strong local AM
stereo stations.

> lastly, does the agc cap mod only effect the agc in the sync mode,
> or normal and sync modes both?

both AM modes.

regards,
phil :)

hi Guy:

FWIW the stock unit should not be deaf. i was able to hear many stations using just a Radio Shack loop. i now use an indoor amplified loop and just crank in some gain. must be nice to have beverages!

from what you described and looking at the R75 schematics you should also check out that 1.6 MHz low pass filter section and the diodes. check for proper antenna selection. thanks for the article by John Bryant.

regards,
phil :)

According to the Kiwa web site, they're back in business in MN, and slowly ramping up.

http://www.kiwa.com/

Dear Kiwa Customer!
Kiwa has moved to Kasson, MN. We are still in the process of setting up shop. At present, the heating system is being installed. We are able to ship small orders like filters, audio upgrades, preamps etc. It will be some weeks before we are set up for loop antenna production. Business phone lines should be installed within a couple weeks. If you wish to place an order, you may do so by sending an email to kiwa@.... Or you may send your order to Kiwa Electronics, 503 7th. Ave. N.E., Kasson, MN 55944. Any orders sent to the old address in Yakima, WA will be automatically forwarded. Thank you for your patience. We will post appropriate notices when Kiwa is back to normal production here at the web site. Regards, Kiwa Electronics

Check out http://www.rtty.com/rtty_list.htm
and http://www.rttyinfo.net/
and http://dxworld.com/utenews.html#RTTY look under "DIGITAL AND RTTY DECODER INFO"

The easiest to catch are the Ham radio RTTY conversations (called QSO's) between 14,080 and 14,090 Khz. The ARRL also broadcasts bulletins of interest to the Ham community in several modes including RTTY just above 14,095 and on several other bands. You can find the schedule on their website, http://www.arrl.org/w1aw.html#w1awsked look under "Teleprinter Transmissions". There is also the Midwest RTTY Net (MRN) 3,607 Khz +/- or 7,070 KHz during Daylight Savings Time in the evenings, check between 8 and 9pm eastern (may start at 8:30pm.).

When you hear a "diddle" sound, that's it. Just below 14,080 you will hear pactor and amtor which sound like RTTY switched on and off, around 14,072 you are hearing psk31. Above 14090 you will hear packet which sound like short bursts of static.

You will find decoders through the above links using only the radio, your computer and a sound card. Have fun!

Marty

Hi Guy,

I am sure you know how to test in such situations, but here is what I would do:
- Bypass with capacitor the whole MW bandpass filter. If this "opens" the receiver then the signal path is interrupted somewhere. If not then there may be signal leak to ground or DC line.
- Check the control voltage on the switching diodes. Is it reaching them?
- Feed signal from signal generator (through a capacitor) at different points on the signal path. See where the path is interrupted.

Good luck,

Rado

Here is what Pete recomend:remove R171 and R173 (270 Ohms), and
replace R172 (18 Ohms) with either a zero Ohm resistor short that
connection point pad that is supposed to bypass the attenuator (it
really
does not, unless you remove R171 and R173). Next, change R174 (10
Ohms)
to a 100 Ohm resistor. Finally, add a 1mH surface mount choke across
the
point where R171 was connected.
Do you remove the two resistors[R171/R173]?Do you short[bypast]the
half moons]pads.Do you change the 10 ohm resistor[R174]for a 100 ohm
resistor? Next,Do you add the 1mh inductor [choke]across the
point where R171 was connected?If you did all this steps, your
problem is not the mod.You said "I'm pretty sure the MW band was not
working right *before* I did the mod" and this can be the key...In my
stock R-75 before I did
the mod,I found that more than 50 stations moving the S-meter from S3
[the far away]
to S20 and S40 the local's.The sensitivity mod improve the reception
of very weak signals[dxing]in the R-75 but there is not problem in
receiving MW weak signals with the stock R75 an a good ant
> *before* I did the mod.
> I double-checked my work before and after my recent DX trip to the
> Washington coast, and I cannot see anything amiss with the

If everything with the mod is ok keep the mod and look for other
causes.

> *before* I did the mod. I received the radio only a couple days
> before doing the S-AM, fidelity, MW atten., and volume level mods.
Do you did the mods in a new or used R-75?
> However, above the MW band the R75 hears as well or better than my
> AR7030.

Yes and after the sensitivity mod,the R75 surpass this and others tabletop receivers in sensitivity of very weak signals in MW band too.

Thanks, Rado. I had thought of the cap bypass and diode check, but didn't think of the basic signal generator test. Looks like I'll need to take the rig back to work to use theirs.

Subject: Re: [icomr75] Re: Now THIS is an Attenuator...

Hi Guy,

I am sure you know how to test in such situations, but here is what I would
do:
- Bypass with capacitor the whole MW bandpass filter. If this "opens" the receiver then the signal path is interrupted somewhere. If not then there may be signal leak to ground or DC line.
- Check the control voltage on the switching diodes. Is it reaching them?
- Feed signal from signal generator (through a capacitor) at different points on the signal path. See where the path is interrupted.

Good luck,

Rado

3188. remote control for r-75?

Yahoo group: icomr75 (2000 — 2002)
Date: 2002-12-11 17:07:19 UTC
From: dukeofbecker <perezcj@cobleskill.edu>
Topic: 3188 Message: 3188

Once upon a time,I was conidering an iCOM R-71 because it had an optional remote control unit available.

In my web searches on the R-75, I have seen some vague references to an available remote control at some dealers.

Does anyone have this R-75 remote control? Does it exist?

Carl

3189. Another Franken-radio!

Yahoo group: icomr75 (2000 — 2002)
Date: 2002-12-11 17:28:17 UTC
From: Dave Ulrick
Topic: 3189 Message: 3189

Hi,

Last night, yet another Franken-radio was born. A friend of mine who works on surface-mount electronics for a living (he claims to lift IC pins on a daily basis :-)) finished installing version 2.1 of the S-AM mod on my R75. I've had less than an hour to play with it, but so far I'm very impressed!

As I expected, the mod to the AGC time constant made the greatest difference. Strong SW stations are substantially more pleasant to the ears. What with SW being SW, there's still fading, but the "clipping" effect which used to accompany the fades is gone, thus making the fading less noticable. This mod alone seems to turn the R75 into a radio that is pleasant for SW program listening. _Passport for World Band Radio_ would be pleased. :-)

As others have reported, the effect of the S-AM mod is somewhat less noticable than that of the AGC mod, but S-AM certainly does more than it used to do. I tried it out on stations which suffered from varying degrees of fading, and heard the most audible improvement on stations which suffered from frequent rapid fading. Both music and voice seemed to "stabilize" a bit once the sync kicked in. So far I'm finding the "howl" that comes while sync is being established to be kinda cool. What's peculiar is if I turn on S-AM, turn it off, then turn it back on, I don't hear the howling noise when I turn it back on. If I wait a few moments to turn it back on, I sometimes hear a slight howl, but nothing as loud as what I get the first time I activate it on a given frequency.

So far I'm very pleased with this mod. Given how inexpensive the parts for the mod were and how little time it took for my friend to rig it up, I must join the crowd of folks who can't understand why Icom didn't make this fix to the R75 years ago. The AGC mod alone seems to make the R75 into a very good program listening radio, and the fixed S-AM provides an extra tool for cleaning up fading stations. All this for less than $20 of parts.

Assorted observations:

1. Only one of the R75's two S-AM modes (as selected by the SET menu) seems to work after the mod is installed. The mode which causes the "S-" to blink now features a constantly blinking "S-". No big deal, though: the other S-AM mode works noticably better than before.

2. If I use the 15 kHz and 6 kHz filter combo, the inner PBT knob actually seems to do a little something. When I turn it with S-AM mode enabled, I can hear the sync howl as I turn the inner knob. I

sometimes use this knob to cut back certain heterodynes which the ANF doesn't seem to get rid of, so I'm happy to see that this trick is compatible with S-AM.

3. For some strange reason, ECSS seems to work better since the mod was installed. Before the mod was installed, I'd often have to retune by a few Hz after hitting LSB or USB to enter ECSS mode, but since the mod, the stations with which I've tried ECSS haven't required any retuning: LSB and USB sound like they're in the same pitch. Each time I've tried this post-mod, I've tried ECSS _after_ trying S-AM on the same signal. Any idea of why this might be happening? Is the sync detector somehow shifting the tuned frequency to match the true carrier?

Thanks again to everyone who's taken the trouble to make their mods available to the R75 community. I appreciate the time you've taken to make a wonderful radio even better!

Dave

3190. RE: [icomr75] ..so what's the deal with RTTY?

Yahoo group: icomr75 (2000 — 2002)
Date: 2002-12-11 18:16:34 UTC
From: HFSSB
Topic: 3165 Message: 3190

Some experimentation will be in order. In general you want to adjust your IF shift and filters to eliminate side interference without getting too narrow and cutting the hi and low RTTY tones off (CW settings would be too narrow), notch filter MUST be off. Some of the RTTY software has on screen tuners that will show you when you have the hi and low RTTY tones adjusted right. If you really get into it you might want to buy an external tuner indicator like the HAL RTTY-1 or a DSP decoder which will have a tuning indicator on it. Sometimes I find it simpler to use Upper or Lower Side Band (SSB) instead of the RTTY mode. When using SSB "reverse" the RTTY shift on the software if tuned in and the letters are still garbled (I think LSB is standard shift if using SSB to receive but sometimes the sender is reversed). You will pick it up as you experiment, it's really not difficult with good software.

PSK31 is fascinating to watch. You tune into one frequency like 14,072 and tune only the software onscreen to receive several transmitting stations even weak signals will be copied. I recommend Digipan (FREE) http://www.digipan.net/

I also recommend "JVComm32" (free) demo version http://www.pervisell.com/download/roote.htm This is a great program, tune around 14,230 and when active and the band is open, you will see scanned pictures being sent by Hams world wide come across your computer screen. Looks like it's now been updated to receive RTTY and other modes.

3193. Re: Kiwa back in business

Yahoo group: icomr75 (2000 — 2002)
Date: 2002-12-11 19:38:43 UTC
From: thinkdx <dx@guyatkins.com>
Topic: 3178 Message: 3193

I just received an e-mail from Craig at Kiwa, who described his household move and the relocation of Kiwa.

He's been very busy with house-hunting and the subsequent settling in... which I can relate to, having recently moved also. Craig is actively getting the new shop ready, wiring up tools and manufacturing equipment, putting in solar panels (he also sells solar gear), and much more.

I've been a good friend of Craig for 16 years, and have always known him to be an experimenter and "mad scientist-inventor" type. Most customers probably don't know that he designs and builds custom tooling to manufacture most of his specialized products, usually out of surplus or salvaged materials (he just LOVES the Boeing Surplus store near Seattle :^) For instance, the spiral wire grooves in the Kiwa MW Loop antenna's frame are accurately cut by a homebrew threaded cutting-rod device that's very ingenious. His PCB drilling jig and PCB etchant tanks are also inventive one-of-a-kind items.

Well, I mention this to give a little insight into one of the radio hobby's small manufacturers. Entrepreneurs like Craig Siegenthaler, Andy Ikin (Wellbrook UK) and Gerry Thomas (Radio Plus) are rare "Davids" amongst the "Goliaths" of ICOM, Kenwood, Yaesu, etc. Their efforts straddle the line between "labor of love" hobby activity and self-supporting businesses. Keep in mind that you're dealing with a one-man operation in most cases, and exercise some patience with the owners of these hobby firms.

Hi Al,

Thanks for confirming (and Rado also) that a stock R75 MW band should be full of signals in an urban/suburban area. Since I've check my modification over and over, I'll next scrutinize the mediumwave BP filter itself, following Rado's useful tips.

Yes, John's article is a good one. We are both "refugees" of the staff of Fine Tuning's "Proceedings" series of books. Although Proceedings has been dormant for years we still like to author radio hobby articles when we get the chance.

Mark Connelly's web site is a good one, not only for Mark's own circuits and projects but for the archived articles written by others.

Keep an eye on the hobby web sites (Hard-Core-DX and others) in the weeks ahead for a new article by John Bryant, Don Nelson, Nick Hall-Patch, and myself. It's a collective piece on "High-Tech DXpeditioning" with lots of useful info.

Excellent trick, Rado. I'll have to remember this one... "human body as signal probe". Of course, to clarify for others, the only places to touch on the PCB should be in the signal path of the highpass/lowpass and bandpass filters before the first preamp and/or mixer. No touching fragile MOSFETs after walking across a rug on a dry winter's day!

Hi Lew,

I disassembled the front panel a long time ago. My memories are not so fresh. First detach the whole front. There are three ribbon cables to the main board that have to be disconnected.
Then you'll easily figure out how to dismantle it. The knobs on the pots are removed by pulling on them. I don't remember if the main dial had a fixing screw - remove the rubber grip and check (I think there was no fixing screw - only friction ... pull it out).
The pots should be on a separate small PCB. I think they are double 10K pots. Finding a replacement should not be a problem.
During the whole operation be careful not the scratch the LCD.

Good luck,

Rado

A cable with a mini stereo plug on both ends works fine. Radio Shack has them. Use the "Line In" jack on the PC sound card, and be sure to right click on the little speaker icon in the system tray and enable this input as the record source (the details of doing this vary with the sound card software).

hi Jim!

the RS-232C i use is #26-117B from Radio Shack. i actually use a mono to mono (two male ends) 1/8" jack from R75 'REC OUT' to my soundcard 'line-in' input... seems to work fine. under Windows OS double click on the volume control in the lower right hand (system tray). this should bring up the 'Master Volume Control'. Click Options -> Properties -> Recording -> Ok. make sure 'Microphone' is selected with a check... you can also adjust the volume (gain) in here if necessary. YMMV depending on your soundcard software.

regards,
phil :)

Thanks Rado, it was a blasted shame the set fell I'm still kicking myself
as the set is my pride and joy, a real good workhorse. I'd just done the MW
mods on the MFJ 1025 phaser, purchased from the states and was getting into
the DX, oh well at least I'll learn a bit about the inside of the set. I
realise now the af knob just pulls off the now broken shaft, so complete
pot will have to be replaced. Icom said they are about aus$15. + shipping
from Melbourne, as we dont have Icom parts stockists here in Adelaide!!!
Just one more Question, having done the MW atten mod on the set, and added
switch, does the newer attenuaton mod including the resistor + inductor
improve the situation much.
Cheers Lew

The whole point of doing mod v2.1 is to make the blinking "S-" useful. It should not blink constantly, only when the synch in not locked (during a howl). This prevents the howls from being heard (the radio uses the AM detector). There must be a trimmer (R6 on the schematic) to adjust the threshold. Try adjusting it.

Regards,

Rado

Do you use the microphone for your recording? I use the line in jack for recording things from my tape player etc. I make sure line in is checked.

I certainly am. It's nice to find a fading signal, enable S-AM, and enjoy the reduction in fading distortion. (For instance, Radio Australia on 9580 kHz at 1300 UTC this morning. My QTH is Rockford, Illinois, USA.) On strong signals with only occasional fading, the AGC mod makes them very pleasant to listen to even with S-AM turned off.

I was wondering what that trimmer was for. :-) I'll open up my radio and try tweaking it. Thanks for the tip!

OK,
I have to refresh my memory. I published an article in Swedens leading DX-magazine on this, with all the steps described. I'll have to read it again ;-).
I used the freeware version (MobileDB Lite). Besides the Palm app, there is a associated Windows app that will do the conversion. Have you tried that?
Get back to you very soon....(tonight CET)

I have the Asia version of R-75 0.03-30 Mhz.
Can some one tell me if i can tune my Icom to
30-60 Mhz like the American version?
(i didn`t find any mod on the web).

3215. 27" MW Torus Tuner with DX398, Icom R75, and Grundig Sat 800

Yahoo group: icomr75 (2000 — 2002)
Date: 2002-12-13 01:59:10 UTC
From: Gordon Hagewood
Topic: 3215 Message: 3215

I received the above loop antenna and it works great. As good or better (at least as good signal strength and less noise) than the Select-A-Tenna - even more noticeable above 1000 Khz . I've tried coupling through the antenna jack using the standard air loop from an old AM/FM receiver as well as inductively to the ferrite rod. Not unexpectedly, the inductive coupling through the ferrite rod is universally superior. The Torus Tuner is also quieter than my coax fed dipole - but has less signal strength than the latter. Had similar results on the Grundig Sat 800, DX399, and Sony 7600GR.

For the R75 owners, the air loop approach is the obvious route and the 27" Torus Tuner outperforms the SAT as indicated above is much quieter (albeit with lower signal strength) than my coax fed dipole.

In short, I'm very pleased with Ed's MW Torus Tuner. It's a big puppy but has found a home with the rest of my gear in my basement shack.

I'll report this weekend on the 16" SW Torus Tuner when used with the above.

Regards,

Gordon

Gordon,

Glad to hear you like the 27" Torus Tuner. I've been using the 16" for SWL since September. Previous to owning this R75 I've used the loop with my Sangean 818 and its quite remarkable on camping trips where I can use the optional preamp. With my R75 I'll feed the loop through it's preamp and leave the radio's amp off. It works pretty good at home but since I've built an outdoor horizontal loop I use that now. I have found that you have to experiment with location , and generally, mine works better upstairs than downstairs. Perhaps it's the elevation.
Ed's very personable and can help you out with any questions.

I bought the 27 Torus tuner about six months ago! It works very well with my DX-398, Sangean 818cs and Grundig Satellit 800. I have a small pickup loop I hook to the Sat800 500 ohm conector to inductive couple the 27 Torus loop too. I'll try the same with the r75 when I get it.

Topic: 3221 Message: 3221

Greetings, seemed my price was too high in previous post. Same deal, same everything but is now $450.00 USD with UPS ground shipping.

Reason for selling, SWL did not excite me that much. Now want a new Uniden digital scanner. My trusty AR3000A provides me with all the AM listening I do. Which is not much to begin with.

Contact me directly via email.

Thanx

You can see the products at www.torustuner.com

Your best bet for technical specifics is to contact the builder, Ed Wawzinski, K3FDY, at edek@hereintown.net. Ed is very responsive to questions and being semi-retired would be happy for you to call him (at reasonable hours!). His phone number is: 301-334-5228. His return policy is: ☐You are entitled to return any portion of the shipment for a refund, that does not meet your expectations.☐

I think you will like this loop.

Gordon

3224. Shortwave Loop: 16" SWL Torus Tuner with DX398, Icom R75, and Grundig Sat 800

Yahoo group: icomr75 (2000 — 2002)
Date: 2002-12-14 15:35:33 UTC
From: Gordon Hagewood
Topic: 3224 Message: 3224

I reported earlier on the 27" MW loop. This is the shortwave listening version. I also bought the small FET amp that sits in series between the loop and your receiver. The amp takes a 9 volt battery and draws very little current so the battery will last a long time. Both the loop and the amp have 1/8" plugs for your portables. I purchased a 1/8" to PL-259 adaptor for use with the Grundig and R-75.

If I can borrow from the Radio Netherlands value ratings, I would give the 27" MW loop 5 stars - note this is the MW loop I reported on earlier in the week. I would give the 16" SW loop 3.5 stars as is, and 4.5 stars with the FET amp. What follows is a discussion of my experience with the 16" SW loop.

Reception in my basement shack, not unexpectedly, was much better than a 23' random wire reel antenna but certainly not up to the coax fed dipole -- given that I was in the basement that's not unexpected either. That said, the loop is somewhat directional and nulls out some noise from my house.

Upstairs on the main floor the loop comes into its own. Very good signal - still not as strong as the dipole but still less noisy - and good nulling capability by rotating and traversing the loop. I found that if I turned off or turned down the RF gain and the FET amp, and then used the capacitive tuning knob on the loop to get a faint signal, I could then turn everything back on for the optimum signal before rotating the loop. I took the loop-amp combo up to the second floor and it worked even better. I've already been advised that I'm not moving my shack upstairs to the guest bedroom.

Since the loop packs flat like a small hula hoop and the amp is smaller than a cigarette pack, I expect this combination to be my antenna of choice for travel. I'm going to take it to my interior office at work and see if I get any signal at all.

Regards,

Gordon

My R-75 will soon be ordered. (must wait...I won't use credit cards!)
Now I must choose and set up an antenna to prepare the way! I am
considering the Alpha Delta DX Ultra. It receives a rave review in
Passport, but it is a bear to set up.
Also, I'm wondering if this level of antenna is overkill for this
receiver...but it seems for a modest cost (~$110 US from Universal)
we might as well get the best. Any advice out there?

P.S.
Anybody from upstate NY out there?

Carl

I'm happy with my 100 foot dipole. Depending on the length of your coax feed, you can probably build the wire, insulator, feed part for under $20 + cost of coax. I use this as the primary antenna (with a splitter) for both the R75 and Sat 800.

Hi Carl:
Congrats on the new purchase. I use a homebrew T2FD antenna that cost me less than $30 (US) to make. http://www.hard-core-dx.com/nordicdx/antenna/wire/t2design.html Unless you don't mind paying $100+ for some wire and insulators, I would never buy an antenna. Homebrew antennas work better anyhow. My T2FD covers 4 MHz to 30 MHz, but I have had success on 75 and 80 meters with it as well. The plans call for a 4:1 balun. I use a 300 to 75 ohm transformer designed for TV....I also use 75 ohm cable TV feed line (RG6). So spend a rewarding afternoon building your own antenna, and pocket the $110 for something more reasonable like a hand-held remote controlled TV.

Good luck,

Jim

Jim's your reference URL to the T2FD is a page of my article I authored for the Proceedings books in the early 1990s, and reprinted by Hard-Core-DX, NRC, and ODXA with my permission. Anyone going to this URL will want to read the rest of the text, too, on other pages at Hard-Core-DX.

Over the years I've built & used a number of T2FDs for tropical band DXing. Most of them were constructed for 90 meters and up. It's a great antenna design; not particularly efficient for transmitting but it gives a uniform impedance across a wide frequency range, and is a quiet receive antenna.

However, I find the statement "homebrew antennas work better anyhow" as whitewashing commercial antennas with a broad brush. The Carolina Beam antenna (The Radio Works Co.) I used for years surpassed my T2FDs for long-haul, low-angle DX signals such as India, and Africans on morning long path. It was designed and marketed toward amateurs for use on 80m and up, but it works great for SWBC reception. The Carolina Beam is more susceptible to noise but provided a better signal-to-noise ratio on those really distant stations in the tropicals. The T2FDs were normally better for general SWLing on the higher bands (RNZI on 17675 was an exception-- the Carolina Beam was phenomenal on this station). Radio Works may not sell this particular design any longer; they used to have two versions available. I know they still sell their "Carolina Windom" of which the Carolina Beam was a variation. Tony Ward, VE3NO, is another DXer I know who speaks highly of the Carolina Beam. Tony's an accomplished MW DXer who also uses the K9AY, a Radio Works' "SuperLoop", and multiple beverage antennas.

In general, I found my Wellbrook Communication's K9AY to surpass the T2FD. This has been my antenna of choice for a few years now. To me, it was worth it to spend the money for something I knew was going to work excellently out-of-the-box. Although I've frequently homebrewed I didn't have time to construct the electronics for this more complicated antenna. Wellbrook's built-in preamplifier, head unit and control box are first-rate. It's a versatile, compact and low-noise design.

I usually stick with beverage antennas on DXpeditions. Only rarely did the K9AY beat the beverages on trans-Pacific MW DX... it's very ground-dependent. If the soil at the WA coast is saturated from days of winter storms, the K9AY can perform neck-and-neck with the beverages. However, in drier soil conditions the beverages are clearly superior. Sometimes we use dual-wire beverages which theoretically give better gain. I don't recall the transformer or impedance details (the parts are owned by a fellow DXer) but it's different than the usual 9:1 beverage, EWE, and flag/pennant transformer.

Bottom line: don't write off commercial antennas; you'll miss some good choices.

Topic: 3231 Message: 3231

I'm new to the group as I just purchased a new Icom R75 today from R and L electronics. It is the best price I have seen for this radio. I paid $439.95 plus shipping. This price is good thru 12-15-02 according to their web site. The web site lists the price as $499.95 for the R75 with the DSP unit and you get a $60 gift certificate for merchandise from their store. Today(12-14-02) was their customer appreciation day and they had a lot of specials. When I called they took the $60 certificate off of the $499.95 price which made it $439.95 and I guess $7-10 for shipping. I think the way it is listed when you do a search of the model number that they will honor web orders through Sunday(12-15-02) as they are closed on Sunday. I ordered mine just before closing and he said they still had a few in stock and also the DSP units to ship with the radio. Thought some might like to know. BTW this looks like a great group and I hope to contribute in the near future. 73 Rick.

welcome aboard Rick! $440 is a GREAT price! [also an excellent choice of displacement for an internal combustion engine] be sure to check out the files section. keep us posted as to your thoughts on the unit. many online descriptions do not do the unit justice: it is small, well built, has nice buttons, beefy tuning knob, super bright display, and an external brick power supply.

regards,
phil :)

Well, I finally took the plunge and ordered the R75 from R&L after seeing Rick's post. I ordered on the web since they are closed. I hope they do the same deal with the $60 certificate that they did with Rick!

Now for a couple of questions:

1. This radio will need an indoor antenna. What does the group suggest (random wire around ceiling, dipole around ceiling and fed with ladder line, etc.)? I plan on listening to utility, military, aviation, marine, etc. comms. Also, since it will be an indoor antenna, will I need to disconnect it during T-storms or to prevent static charges?

2. Is anyone on the list in the D/FW area and comfortable with performing the mods talked about on the group? What little bit of soldering I have done was rather crude and I would hate to toast a new receiver.

TIA for any help.

I have been lurking on this board for a while and have "learned" quite a lot, although the posts get a bit over my head as far as the "techie" stuff goes.

Scott

I am new to the hobby of SWL and recently moved up from a Roberts 891 portable to the IC R75 with a Wellbrook ALA1530. I am only interested in broadcast listening for the time being and took the advice of Universal Radio and got the optional FL103 and 257 filters.I find the manual rather unhelpful with regards to the filters and I would be grateful if someone could let me know in simple terms how to sey up the filters for broadcast listening. Thanks.

I have such a wire and my R-75 prefers it to my outside DX/SWL sloper. Go
figure. I connect only one leg to the red binder on the R-75. The set gets
its ground from the Sloper Co-Ax.

Scott,
Don't feel so bad as I've been observing these posts for a long time and I'm still in a fog. I've been using my radio as is, and thus far I've been happy. But maybe I could be even happier with the mods but I too don't trust my soldering ability, and if and when I do anything, I guess I'll have to send to KIWA. From what I've read, the AM and fidelity mods are very good ones, but then again, what do I know.

Hi Moxie 3:Why not go to your next TV, computer or audio repair shop
with a copy of the intructions and a copy of the online service
manual [files].They are working everyday with this kind of "SF" micro
components..The AGC mod and the "Phildelity" mod are very easy mods
[1 cap 4 resistors to solder.]
Atagrasin.

Atagrasin,
You're probably right having a TV, computer, etc. repair shop perform the work using the instructions but I have my reservations. If I'm going to have it done, I would prefer someone who has done it before and doesn't need instructions. I'm just surprised there isn't anyone other than KIWA doing the work. I would prefer paying someone locally rather than having to ship the unit, but I don't believe that will be the case. So when and if I get the work done, I'll have to bite the bullet and ship it to KIWA.

Russ and others,

Where is a good place to get a small pickup loop? I have one on my Onkyo stereo receiver; it's self-standing, about 5" across by 5" tall by 1/2" thick (not counting the base).

I believe it's a Sagami 4910 standard loop antenna (link below).

http://www.sagami-elec.co.jp/english/product/loop.htm

I use this to inductively couple to a Black Box Antenna, which is a 7" by 10" tunable, rectangular loop. It's sort of a small, rectangular version of the Select-A-Tenna. This combination works well.

If anyone knows where to get a small, self-standing pickup loop like the Sagami 4910, please let me know. I didn't see anything like this in the Radio Shack catalog.

Thanks,
Gary

hello, you will probably want the following setup:

SSB narrow 2.4, 2.4
SSB normal 2.8, 15.0
SSB wide 15.0, 3.3

here is the procedure...

Press 'SSB' to enter either LSB or USB [doesn't matter which].
Press and hold 'FIL' for 2 seconds until '9M' is displayed.

Press 'UP' until 'EXP' is displayed.
Turn the dial until 'EXP oN' is displayed.
Press 'UP' until 'oP1' is displayed.
Turn the dial until '103' is displayed.
Press 'Up' until 'oP2' is displayed.
Turn the dial until '257' is displayed.

Press 'Up' until '9M' is displayed.
Turn the dial until '2.8' is displayed.
Press 'Up' until '455k' is displayed.
Turn the dial until '15' is displayed.

Press 'Up' until '9M' with N above [narrow] is displayed.
Turn the dial until '2.4' is displayed.
Press 'Up' until '455k' with N above is displayed.
Turn the dial until '2.4' is displayed.

Press 'Up' until '9M' with W above [wide] is displayed.
Turn the dial until '15' is displayed.
Press 'Up' until '455k' with W above is displayed.
Turn the dial until '3.3' is displayed.

Press 'FIL' to exit filter setup mode.

Usage: tune a station, press FIL to cycle through the three filters.

you can do something similar on AM by pressing AM [make sure you're
in the AM not SAM mode] before FIL and setting them up as follows:

AM narrow 2.4, 2.4
AM normal 15.0, 3.3
AM wide 15.0, 6.0

when done try this... apply PBT [turn both in same direction] while
using the 3.3 kHz filter under AM [aka not SAM].

phil :)

From: labdog98f <scannerfreq@worldnet.att.net>
Topic: 3244 Message: 3244

Bill and George, thank you for your replies.

Since I do not have an outdoor antenna, should I just connect a single random wire to the red binding post or do I need a ground? Speaking of grounds, I have just used scanners and RS SW radios (with a random wire alligator clipped to the external ant.) in the past so I do not have any kind of shack/station ground spot connected to a ground rod outside. Since this is receive only and no transmit, what should I use as an:

1. RF ground

2. Antenna ground

3. Electrical ground?

I had thought about a kind of "homemade" dipole connected to the R75 using balanced ladder line or 300 ohm twin lead. The actual wire lengths would be the same (about 16' each around the ceiling where it meets the wall). Would this work? What do the more technically astute in the group suggest?

Thank you again for any advice for the rookie on the group.

Scott

3245. Newbie question part II

Yahoo group: icomr75 (2000 — 2002)
Date: 2002-12-16 03:27:13 UTC
From: labdog98f <scannerfreq@worldnet.att.net>
Topic: 3245 Message: 3245

After going through some of the prior posts, I have picked up the RS RCA external speaker (40-5000) and I am looking at the

B&W ASW-60 Multiband Trap Listening Antenna
11 through 60 meters

I see they still show it as a web special for $35 with either 50 or 75ohm coax or twin-lead feed line. Will this cover all of the "action" areas as far as USAF GHFS, Aviation, Marine, Coast Guard, Mil-coms, etc., or will a lot of it be "blocked out" since the antenna is tuned just for 11-60 meters (4750 - 26100 KHz)? Could this antenna be used strung up around the ceiling where the wall meets?

Sorry for all of the questions, I just want to make this as good of a listening "post" as I can based on what I have to work with.

Thank you all again.

Scott

3246. Re: filters

Yahoo group: icomr75 (2000 — 2002)

From: just_rtfm <just_rtfm@yahoo.com>
Topic: 3234 Message: 3246

hi Samson:

i do not own the filters you have but i would probably go with this...

SSB narrow 2.4, 2.4 [1]
SSB normal 2.8, 15.0 [main usage]
SSB wide 15.0, 6.0 [2]

note [1]: apply PBTs in opposite direction to further limit bandwidth
and change tone... works well with hams and utility (voice).

note [2]: use for ECSS tuning (aka tuning AM stations as if were
SSB): change frequency in 1 Hz increments until flutter is no longer
heard, then switch back to SSB normal.

AM narrow 2.4, 2.4 [3]
AM normal 2.8, 15.0 [4]
AM wide 15.0, 6.0 [main usage]

note [3]: apply PBTs together under AM (or just the outer PBT for
SAM) to enhance either the upper or lower side of the signal.

note [4]: apply outer PBT to enhance upper or lower side of signal. i
would use this over the one above due to ease and wider bandwidth.

FM normal 15.0, 15.0 [main usage]
FM narrow 15.0, 6.0 [5]

note [5]: you may find this setting too narrow.

CW normal 2.4, 500 Hz [main usage]
CW wide 2.4 2.4 [6]

note [6]: for wide RTTY or to see on a bandscope. twist PBTs in
opposite directions to narrow bandwidth further.

regards,
phil :)

Another possible choice for SSB normal with your filters should be 2,8 and 3,3 kHz filters.

Subject: [icomr75] Re: filters

hello, you will probably want the following setup:

SSB narrow 2.4, 2.4
SSB normal 2.8, 15.0
SSB wide 15.0, 3.3

here is the procedure...

Press 'SSB' to enter either LSB or USB [doesn't matter which].
Press and hold 'FIL' for 2 seconds until '9M' is displayed.

Press 'UP' until 'EXP' is displayed.
Turn the dial until 'EXP oN' is displayed.
Press 'UP' until 'oP1' is displayed.
Turn the dial until '103' is displayed.
Press 'Up' until 'oP2' is displayed.
Turn the dial until '257' is displayed.

Press 'Up' until '9M' is displayed.
Turn the dial until '2.8' is displayed.
Press 'Up' until '455k' is displayed.
Turn the dial until '15' is displayed.

Press 'Up' until '9M' with N above [narrow] is displayed.
Turn the dial until '2.4' is displayed.
Press 'Up' until '455k' with N above is displayed.
Turn the dial until '2.4' is displayed.

Press 'Up' until '9M' with W above [wide] is displayed.
Turn the dial until '15' is displayed.
Press 'Up' until '455k' with W above is displayed.
Turn the dial until '3.3' is displayed.

Press 'FIL' to exit filter setup mode.

Usage: tune a station, press FIL to cycle through the three filters.

you can do something similar on AM by pressing AM [make sure you're
in the AM not SAM mode] before FIL and setting them up as follows:

AM narrow 2.4, 2.4
AM normal 15.0, 3.3
AM wide 15.0, 6.0

when done try this... apply PBT [turn both in same direction] while using the 3.3 kHz filter under AM [aka not SAM].

phil :)

Scott,
Before spending the $$ for the B&W antenna go ahead and try out the 32 foot dipole you mentioned in your previous post. You should also try running a wire from the 'red' terminal up your wall and then run it along the wall ceiling junction. Not being familiar with the B&W I can't comment on how well it works - especially outside it's design parameters. The traps will assure a truly 'ugly' (at least to non-radio folks) installation and you will still have home-generated noise to deal with. Were it me, I'd just use a thin diameter wire that blends into your wall/celing color and put up as much as possible & try to stick to outside walls.

If you're interested in how I've handled indoor antenna's in more detail let me know & I can e-mail you some drawings (GIF format) & some of the mistakes I learned from.

Good luck,
Howard

Dear friends,

I have had an IC-R75 for two months now and I would like to share with you some ideas and impressions.

I am writing now, after two months of careful reading of the list messages, because I wanted to gather personal data and I was aware it takes a little while to get used to all the opportunities the receiver offers and to learn to operate it properly. Phil's cookbook was an excellent reference.

Previously I owned a Yaesu FRG-100 and I was quite happy with that, but as you might know, after a while it is nice to have a change. This decision was helped because I already had a buyer for the old Rx and I found a 3hr-old R75 at half the original price (here in Italy it goes around 1000$ for a new one). Adding a little of money to what I got for the old Rx I also added the DSP unit scoring a total of 600$ (when I read about your US prices I feel a bit envious).

Actually, in the beginning I fancied a JRC or a Drake, but their price was impossible (around 5000$ because of the import duties).
Nonetheless I made my research and in the end I came to the point I started, R75.

The setting here is quite basic and my listening habits are mainly utility oriented, but I don't mind SWBCL.

The R75, as I said before, is an out of the box plus DSP.

Filter setting is as follows:

SSB:

Normal: 9M = 2.4; 455K = 6
Narrow: 9M = 2.4; 455K = 2.4
Wide: 9M = 15; 455K = 6

AM/S-AM:

Normal: 9M = 15; 455K = 6
Narrow: 9M = 2.4; 455K = 6
Wide: 9M = 15; 455K = 15

CW:

Normal: 9M = 2.4; 455K = 6
Narrow: 9M = 2.4; 455K = 2.4
Wide: 9M = 15; 455K = 2.4

RTTY:

Normal: 9M = 2.4; 455K = 2,4
Narrow: 9M = off; 455K = off
Wide: 9M = 15; 455K = 2,4

FM:

Normal: 9M = 15; 455K = 15
Narrow: 9M = 15; 455K = 6
Wide: 9M = off; 455K = off

(If you feel filters mix could be improved, please fill free to send suggestions, TNX!)

Antenna: 12,5 m , 18 m from the ground on the East - West axis coupled with a Magnetic Longwire Baloon by RF Systems.

Software used:

Radio Raft, ALE, RadioCom4, and Smart Icom Control.

I am quite lucky because I can work a lot of time at home and the RX is on my desk, by the computer, so while I work I can casually listen to some transmission or scan frequencies I prepared with Smart Icom.

After two months I am happy with the receiver and this are my general comments.

Audio: I think this is the weakest part of the receiver. As many others in the list I operate with the DSP almost on and I find the Audio a bit flat, missing intermediate and high tones. I temporarily solved this in two ways. 1) Headphones (Sennheiser HD 530 ii) 2) I work a lot with Twin PBT and mix them with narrow and wide filter selection. When signal is reasonably strong I opt for the W selection and it sounds FM like, even through the speaker.

I am thinking of buying a better external speaker. I regret all the ext. you mentioned in the messages are not available on the European market, otherwise I would have already bought one. If you have suggestions, please do tell me! I understood the RCA one was a good one, but shipping it to Italy it would cost more than the speaker itself.

The NB is effective. I live in a cond and during Xmas time people have trees with lights going on and off causing a lot of noise. This is the first Xmas my evening listening sessions are not disturbed by these. I wish I could do something for TV sets interference. My own generates noise straight on 8906 (MWARA NAT-A).

The NR and ANF work pretty well, although using them together has frequently bad effects on the output audio. I mean, adding the ANF while the NR is already on will deteriorate the audio in a way, I am afraid, my linguistic skills cannot describe.

Nonetheless I fully appreciate what they can do. Please consider I usually use NR with level 4 or 5. These are some comments from my logs of BC stations:

17870.00 kHz 1809 10 Nov 02 USB SINPO 35233 Channel Africa, S. Africa, NR Level 10, Twin PBT ON, very weak signal, a lot of statics but heard from USB. PREAMP 2 ON.

13750.00 kHz 2115 13 Nov 02 AM SINPO 35222 Radio Havana Cuba, a lot of background noise and QSB. Reduced by means of NR Level 10. Pre 2.

21730.00 kHz 1127 16 Nov 02 AM SINPO 35323 V of Islamic Rep of Iran, Listened to in ECSS to reduce QSB.

9730.00 kHz 2129 10 Nov 02 USBN SINPO 53534 Voice of Vietnam, NR 10.

17650.00 kHz 1630 04 Dec 02 AM SINPO 42333 WHRA Maine, Strong Beat Tone, but almost completely reduced by ANF.

Generally speaking I have to say I am happy with the S-AM, although I cannot say if the S part of it is bad or good. I have it constantly on and I enjoy the listening.

I started with BC as it is not my favourite Rx activity.

Utility is where I am most enjoying the receiver. Its sensibility and selectivity are just great and my logs are richer of beautiful logs, from areas that were almost absent before (although during periods of better propagation conditions). They include MWARA SEA 1,2,3, AFI 4 and SP 6-7. I am still missing CEP (all zones), but I am a stubborn listener ;-)

Now, if you were kind enough to follow me up until now, I come with my questions.

I am going to generate, with a friend's help much better at soldering, a Franken radio.

As you understood Utility is my favourite, so I would like to make some mod that would improve the radio in the whole, without compromising its excellent performance in the SSB side.

I was thiking of Phil's Phidelity mod to increase the quality of audio when using DSP NR in SSB.

As the RX is a bit deaf in the MW and LW bands (where some utilites are around as well) I was thinking of something as the Rado's one (BTW, this is the only one I could not find in the files section, could you please tell me where I could find it?).

I have to say that I was recently confused reading some messages about mods, so my final question is:

Could you please suggest what you think might be the best mods considering my listening habits? Could you please list them in order of preference / priority?

I thank you all in advance for your coming suggestions and I wish you all a Merry Xmas and a 2003 full of happyness and peace.

I am very happy to belong to this discussion list.

Michelangelo I1-2140 (licensed SWL since 1986, listening to since 1976).

3250. Re: My R-75 countdown begins ...Antenna choice must be made

Yahoo group: icomr75 (2000 — 2002)

Topic: 3226 Message: 3250

Nice posts!! Much appreciated.

Guy & Jim,
Your technical saavy and experience far surpass any knowledge my heretofore casual SWL status belies! As a result of your posts I've been sniffing around http://www.hard-core-dx.com regarding T2FD design and http://www.radioworks.com for the Carolina Windom. Also, the http://www.wellbrook.uk.com/ has promising but expensive options.

I suppose I would initially be happy with any of the above.

Question: Being of Carribean heritage, I have always been intrigued with the possibility of Tropical Band (90-120m) reception. Up to now, I have only used small portables (no ext. antenna) and have in general, not been able to receive much in these SW bands. I am blessed with 2 acres of land and am able to put up antennas of length 200 feet (or even longer!). A T2FD design of 100 feet is said to cover 90 meter band well. How about the 120 m band? Some formulas suggest that a lowest frequency of 2250 kHz requires antennas of approx. 200 feet.

Is the significant extra effort (a 200 feet T2FD design) worth the result in this lowest freq SW band? Is there much transmission going on down there?

Another question: The hard-core-dx website seems to imply the T2FD is installed in sloper fashion, with one end elevated and other spiked to the ground. Right angle trigonometry tells us to insure an angle of elevation of 30 degrees on a 100 foot long antenna means the elevated end must be half the length or 50 ft high. Yikes!...Is the sloper type install preferred? Does it really have to be as tall as half the length?

Any advice out there?

Thanks again...You've are a great and energetic group!
Carl

Bill,

If you're going the indoor route, check out the threads by Gorden and Russ regarding the Torus Tuner. I have the 16" and am happy with it as an indoor alternative.

1. This radio will need an indoor antenna. What does the group
suggest (random wire around ceiling, dipole around ceiling and fed
with ladder line, etc.)?

I have such a wire and my R-75 prefers it to my outside DX/SWL sloper. Go
figure. I connect only one leg to the red binder on the R-75. The set gets
its ground from the Sloper Co-Ax.

Scott,
Seems like you're going down a similar path I took a few months ago. I'm using the B&W dipole you mentioned. Originally, I was using a long wire antenna, about 70 feet
or so and attempted to achieve better reception by getting the dipole. So I bought the aforementioned B&W antenna. However, I couldn't tell much, if any, difference between the 2 antennas at any frequency. Keep in mind that I only listen to SW broadcast; maybe in the future I'll expand my horizons. Someone mentioned on this site that a dipole should be quieter than the long wire but I couldn't tell there was much of a difference. I still have the wire but only use the dipole. I understand the Wellbrook is a fine antenna; they have one for inside and outside use. I'm thinking of buying one myself, an outside unit that is.

As far as grounding, this is an area with a lot of opinions. You may want to check previous posts on this subject. But I have
been told and read that grounding is veeeerrrry important for several reasons. There are several options to you but this is what I did: I bought an 8 foot ground rod from Home Depot and placed it as close as possible to where the radio will be. I purchased solid copper wire, I think 4 gauge, and ran it from the rod to an area in my 2nd floor attic (my radio is located on the 2nd floor). I purchased a wire block from Home Depot for about $3 or so - this is essentially a connector for several wires. This block is where my 4 gauge wire terminated, and where my ground wire to the radio started. This is how I grounded my radio. I believe I used 12 gauge wire from the block to my radio (I may have had to thin the wire to make it connect to the ground connector). Since I have a dipole, I purchased a coaxial lightning arrestor from Industrial Communication Engineers, Ltd. (1-800-423-2666) - I bought Model 300/U for frequency range .1 - 50 Mhz. for $38 plus actual shipping. I attached my coax from the B&W to the 300/U, then coax from the 300/U to the radio, and a ground wire from the 300/U to the ground block. I hope this helps some.
George

3254. R75 filter ???'s

Yahoo group: icomr75 (2000 — 2002)
Date: 2002-12-17 00:05:06 UTC
From: k8dxn <k8dxn@charter.net>
Topic: 3254 Message: 3254

While awaiting my R75 to arrive, tomorrow I hope, I have been reading about the radio and I have some ???'s. What is the stock bandwith of the filters for ssb and is this a crystal filter like the stock ones in my ham rigs? Universal says it is 2.1 in their sales description but I see some references to 2.4 on some posts. I haven't found it in Icoms literature. Also I have a chance to purchase some Inrad 1.8 filters for both IF's. I know the 9mhz is a plug in that will fit but the 455 is larger than Icoms and requires some extra room. Is there room in there for this filter? I would really like to know from someone who has instaled this or knows someone who has and what they had to do to make it fit. In the manual I downloaded it looks like the filter is held in place with a clip assembly. My main interest will be utility and ham band stuff and maybe some night time BCB listening. This makes me think about bringing out my old 5 tube plastic radio I used for years . Anyway thanks for any and all help. 73, Rick.

Also I have a chance to purchase some Inrad 1.8 filters for both IF's. I know the 9mhz is a plug in that will fit but the 455 is larger than Icoms and requires some extra room. Is there room in there for this filter? I would really like to know from someone who has instaled this or knows someone who has and what they had to do to make it fit. In the manual I downloaded it looks like the filter is held in place with a clip assembly. My main interest will be utility and ham band stuff and maybe some night time BCB listening. This makes me think about bringing out my old 5 tube plastic radio I used for years . Anyway thanks for any and all help. 73, Rick.

Hi - your radio will be an absolute winner straight out of the box for utility and ham bands. BCB stuff is helped considerably by modifications, discussed at length on this group.

The filter is a 2.4, pretty good for SSB, narrow for AM, a little wide for code and RTTY.

Hi Carl,

Although there's still broadcast stations to be found on 120 meters and the tropicals in general, the situation is certainly in decline. However, if you were to combine your tropical band interests with utilities on the same bands, then you'd have many more targets! It really depends on what turns your crank, as they say.

The 120m stations I have heard over the last few years include:

2310 VL8A Alice Springs, Aust. (a regular here)
2325 VL8T Tennant Creek, Aust. (also regular)
2485 VL8K Katherine, Aust. (ditto)

2410 R. Enga, Papua New Guinea (fairly common here when it's on the air, but considered the toughest PNG except for the occasional clandestine like Radio Free Bougainville... one of my better catches)

2340 Fujian PBS, China (pretty common)

The Aussies are the strongest signals, with Fujian not far behind. It helps to have a RF-quiet environment when tuning 120 meters because none of these signals are powerhouses.

The 90 and 60 meterbands have the most activity, although not like in the 1970s and 1980s.

A T2FD for 120meters and above would certainly be unwieldy, and in my opinion there are better choices. And you're right about the 30-degree angle; it's supposed to be the key to omni-directional reception and helps maintain the even impedance across the bands (if I recall correctly). The weight of the components of a 120m T2FD would be pretty heavy, and subject to a lot of sag (droop) in the antenna unless you pulled it REALLY tight. The antenna parts would have to be very sturdy to endure under this tension, not to mention resist the effects of storms and wind.

I suggest you read up via internet searches on the following antennas: EWE, KAZ & "SuperKAZ", and the K9AY. The first two are pretty simple to erect. All of them need a good low-noise preamp to receive well (the KIWA units, Advanced Receiver Research, or from Wellbrook). I like the ARR preamps because they are good *and* fairly inexpensive. Any of these antennas can do very well on the tropical bands.

I'd recommend checking Mark Connelly's site for articles such as John Bryant's piece on the KAZ and "SuperKAZ". John and I are good friends who DXpedition together every year, and I respect John's careful antenna testing

and subsequent articles on his findings. Here's a link to a lot of good reading on Mark's site: http://www.qsl.net/wa1ion/

Michael Schnitzer has written a fine piece about his experiences with the EWE antenna: http://www.dxing.info/equipment/ewe.dx This is a remarkably simple, but directional antenna. Those who have built them seem to really like their performance *if* they have relatively good ground (soil) conditions.

Lastly, you might try some "mini-Beverages" like I did at my last home. If you can run out 200 feet or more wire, 6 to 8 feet above ground, and terminated & matched as a typical beverage antenna, you might be surprised! My mini-beverage was very directional toward Papua New Guinea and Indonesia; it often beat the Carolina Beam for DX from that part of the globe.

Enjoy those 2 acres! :^)

Subject: [icomr75] Re: My R-75 countdown begins ...Antenna choice must be made

Nice posts!! Much appreciated.

Guy & Jim,
Your technical saavy and experience far surpass any knowledge my heretofore casual SWL status belies! As a result of your posts I've been sniffing around http://www.hard-core-dx.com regarding T2FD design and http://www.radioworks.com for the Carolina Windom. Also, the http://www.wellbrook.uk.com/ has promising but expensive options.

I suppose I would initially be happy with any of the above.

Question: Being of Carribean heritage, I have always been intrigued with the possibility of Tropical Band (90-120m) reception. Up to now, I have only used small portables (no ext. antenna) and have in general, not been able to receive much in these SW bands. I am blessed with 2 acres of land and am able to put up antennas of length 200 feet (or even longer!). A T2FD design of 100 feet is said to cover 90 meter band well. How about the 120 m band? Some formulas suggest that a lowest frequency of 2250 kHz requires antennas of approx. 200 feet.

Is the significant extra effort (a 200 feet T2FD design) worth the result in this lowest freq SW band? Is there much transmission going on down there?

Another question: The hard-core-dx website seems to imply the T2FD is installed in sloper fashion, with one end elevated and other spiked to the ground. Right angle trigonometry tells us to insure an angle of elevation of 30 degrees on a 100 foot long antenna means the elevated end must be half the length or 50 ft high. Yikes!...Is the sloper type install preferred? Does it really have to be as tall as half the length?

Any advice out there?

Thanks again...You've are a great and energetic group!
Carl

hello Michelangelo:

random thoughts...

loop antennas can sometimes help with local noise. MW and LW require different antennas... "normal" shortwave antennas will work poorly. outdoors you can use beverages (very long) or a K9AY loop (40 foot square needed). indoor amplified loops do very well, ex. the Quantum QX Loop. you could also build a box loop.

ICOM's speaker is very covered with protective plastic (muffled). i recommend trying inexpensive amplified computer speakers with volume and tone controls hooked to the R75's 'REC OUT'.

Gert told me a trick for the NB: on AM turn the AGC OFF and correct the RF gain until the NB works. the AM AGC is strong and sometimes reduces signal to the point where the NB gate does not work.

if you like utilities the stock R75 is very good. i recommend the AM AGC, Sync-AM, and possibly my fidelity mod. there are some drawbacks regarding my mod: [1] there will be more high-frequency noise on SSB. often twisting the PBTs in opposite directions (narrowing) helps. [2] in crowded shortwave bands you may be able to hear a 5 kHz heterodyne (the carrier of the next station over). the inner PBT is effective as well as the ANF (last resort). a better solution are speakers with a tone control as mentioned above.

i recommend your friend look at my soldering PDF. leave the leads long for my fidelity mod and try the 90k-ohm resistors first [aka intermediate fidelity enhancement] or go for the 47k-ohm and speaker with tone control. after the mod the sound will not be flat!

Merry Christmas!

regards,
phil :)

The 9 MHz filter for normal SSB is 2,4 kHz crystal filter. This filter is in series with a Murata ceramic filter CFJ455K13 in the 455 kHz IF with a bandwidth of something like 2,5-2,7 kHz. Together about 2,25 kHz in my R75.

Russ and others,

Where is a good place to get a small pickup loop? I have one on my
Onkyo stereo receiver; it's self-standing, about 5" across by 5" tall
by 1/2" thick (not counting the base).

I believe it's a Sagami 4910 standard loop antenna (link below).

http://www.sagami-elec.co.jp/english/product/loop.htm

I use this to inductively couple to a Black Box Antenna, which is a
7" by 10" tunable, rectangular loop. It's sort of a small,
rectangular version of the Select-A-Tenna. This combination works
well.

If anyone knows where to get a small, self-standing pickup loop like
the Sagami 4910, please let me know. I didn't see anything like this
in the Radio Shack catalog.

Thanks,
Gary

A pure accident discovery. I noticed that if choosing the SSB Wide filter selection (15 and 6 filters) and then commuting to LSB you can hear USB pretty well and with some interference reduced. Did someone else noticed / experienced that?

I believe you are referring to my post reference the "blue water cruiser net". It is a net where many boats down in Baja waters and also as far south as south America. I don't have any idea where you are but that net is usually loud here in Lake Havasu Arizona. I am not sure what nights it's on but I have heard it several times. I neglected to make note of the night(s) I listened however. I doubt that it is on sundays. Good luck, Jim K0JAD

Consider the alpha-delta sloper. With that much space you could go with the long one which is supposed to be good down to 160m. It only needs to be 25 feet high at the end that is fed and 10 feet high at the other. It has a low angle of reception. Universal radio has it.

Carl:
It's great to have people like Guy Atkins around to share
information with us. If it weren't for the pioneers, I'd be lucky to
log stations further than 100 miles away. To answer your question,
one has to consider factors that are out of our control: location,
yard space, noise sources, and how much are we willing to spend. By
the way, another nice featuure of homebrewing your antenna, is that
you can experiment with different types of antennas without having
to pick up a second job. For the tropical band, I would consider the
K9AY or a beverage antenna.

I checked out the price on that "special" bargin on ebay. Wow!! I wonder if labdog98f got his R75 for the same price I did. If you read this please let me know if they took the extra $60 off on yours like they did for me. I think that they would as they are really good people to deal with. $449 and some change including the shipping and the free DSP. I just got it in this evening and have it running in the shack now. I will put the DSP in tomorrow.

Thanks again, Guy and Jim

The EWE, SuperKAZ, and K9AY options all look great. I suppose I'm leaning toward the K9AY for tropical band/MW coverage and perhaps a homebrew T2FD for more general HF coverage. (Though I hate to pay ~$40 US for that overseas shipping!)

The Wellbrook site advertises the K9AY as designed for LW and MW reception. I wonder, how does it fare on the higher end of the freq spectrum? Is it silly to have both the K9AY and a T2FD?

3273. Kiwa "MAP" on Ebay

Yahoo group: icomr75 (2000 — 2002)
Date: 2002-12-18 19:52:10 UTC
From: thinkdx <dx@guyatkins.com>
Topic: 3273 Message: 3273

The good news is that there is a rare Kiwa MAP accessory listed on Ebay. The bad news is that (right now, anyway) it's bundled with an ICOM R71a.

I've contacted the seller and encouraged him (or her) to list additional details of this unique receiver accessory, and I shared the high points which are not given in the auction. Also, he or she will hopefully follow my advice and split the auction into separate auctions. It was my contention that those enthuasiasts who are familiar with the rare MAP device won't probably be in the market for an R71a at the same time.

I've owned two MAPs, and my current one recently came out of its original carton for the first time. I haven't hooked it to the R75 yet, but the combo should perform better in selectivity and audio quality just as with any other 455 IF receiver... not to mention the additional choice of synchronous-AM the MAP provides.

In short, the MAP was a competitor to the Sherwood SE3, but offered more features, was better built, and looked better too (I'm biased, though, as I was the designer of the MAP front panel for Kiwa.) Unfortunately the MAP only sold about 50 units before it was discontinued-- it was way too labor-intensive to build, and not very profitable. This accessory has something like 40 case screws and is built like the proverbial tank.

I particularly like the extra, cascaded-filter selectivity the MAP provides, using a similar approach to Kiwa's Premium Filter Modules.

The Ebay URL is:
http://cgi.ebay.com/ws/eBayISAPI.dll?ViewItem&item=1946424376

Check back in a day or two, as the seller may be splitting the auction up, and/or adding more details. If you're looking for a special accessory for the R75 and appreciate Kiwa quality, this is one to watch.

By the way, "MAP" stands for Multiband AM Pickup.

Hi Carl,

Back when I got my K9AY from Wellbrook the exchange rate was much more in our (USA) favor! Don't forget that if you're up to it you can construct your own K9AY... see the files in the K9AY Yahoogroup for reprints of the original article.

I've used my K9AY 95% of the time on shortwave, and found it very good for DXing and general listening. Above 19 meters I would rate it only "average". Performance on the tropical bands is much better, but don't expect more than the occasional signal to show some directionality (nulling) with the K9AY when tuning above 120 meters. The 2-3 MHz range is where the directionality begins to diminish quickly. I noted an odd station or two on 60 meters, at times, would respond to the loop's switching and termination adjustment controls, but it was nothing significant or useful to aid the reception.

The K9AY's main benefit on shortwave, in my opinion, is local noise rejection. The null can be put on a nearby pest (neighbor's PC, TV, vaccuum cleaner, etc.) and the racket is reduced pretty well. (Although not as well as with the MFJ-1025/1026 and JPS ANC-4 units.) The K9AY is also less visually obtrusive than the T2FDs I've had in the past. Since I made occasional forays into mediumwave from home, tuning around for trans-Pacific DX, the usefulness of the antenna on MW was a plus for me.

If you don't need the MW directionality, and your 2-acre site has the needed supports, I'd go with the T2FD and save the costs and complexity of the K9AY. Just be careful if you try a 120 meterband T2FD, as it would be a monster.

hi Guy:

my main usage nowadays for the R75 is medium wave reception. i use an indoor amplified loop. i have a shortwave loop also and agree that the benefit is their directional nature with regard to local noise. i've never used the MFJ or ANC units. a friend of mine built his own K9AY and really likes it for MW. he also uses a phaser.

do you mind sharing with us what receivers you own and have owned? i believe i've read your reviews of the 7030+ and FT-920. i would love to know your opinion of the R75 on medium wave for both the stock unit and after the MW attenuator bypass, AM AGC, Sync-AM, and fidelity mods.

regards,
phil :)

3277. Mac to R75 serial(RS232) cable solution.

FYI

I have found a wiring scheme that allows my Macintosh to
talk to the R75 using a serial port (this also works
for USB-Serial Keyspan adapter.)

See http://www.experbyte.com/macr75/mac_to_r75_serial_cable.html
for details.

This might also allow VirtualPC users to run PC control software
for the R75 - I'd appreciate if someone can confirm this.

Regards.

Topic: 3278 Message: 3278

hi Phil. first off are the last if filters all 455 kHz? in the manual, depending on mode, the if frequencies are several different oddball frequencies. you said your $19 filter couldnt be used for ssb because of "flutter". could you elaborate please. i was thinking of using it as a ssb wide filter for ECSS. thanks, BOB..

3279. Re: My R-75 countdown begins ...Antenna choice must be made

Yahoo group: icomr75 (2000 — 2002)

From: thinkdx <dx@guyatkins.com>
Topic: 3226 Message: 3279

Phil,

I cannot comment much on the R75, as I just got it recently and performed the mods ASAP even before using the rig in stock form. As a former lurker in this group I was convinced of the usefulness of the mods before I bought the used R75. After I get the time to pursue & fix the MW bandpass problem on the radio, I'll be able to comment on the radio's abilities on trans-Pacific MW stations; I'll probably be back at the WA coast in a month or two.

However, my initial impression (on a recent DXing trip to the WA coast) is that the synch/AGC and fidelity mods to the R75 made it a close 2nd as a DXing machine to my AR7030. I like the audio better on the AOR, and I know it will have a further edge in fidelity and weak-signal intelligibility after I do the Kiwa audio mod. I have the parts here, but this is another temporarily-shelved project. My 1st AR7030 had the Kiwa audio mods, and sounded noticeably better than stock.

I've enjoyed owning different receivers over the years, but I've only owned 1, 2, or sometimes 3 at a time. I developed a strong preference for rigs with good audio quality, not just for enjoyment of the content but as an aid to IDing weak DX. Signals are already distorted enough from their long ionospheric trip... why should the receiver add to the garble?

Below are the tabletop receivers I've owned in order, with brief comments where appropriate:

Hallicrafters SX-71 (my first receiver in 1970, a Christmas present from my dad, circa 1970)

Realistic DX-150A

Yaesu FRG-7700 (pleasant SWL rig; too bad it's lacking S-AM. Love that amber-color readout!)

ICOM R-70 (excellent for ECSS with the pricey FL-44A filter. Even in stock form this is a great value as a used DXing receiver, ~$300 at Ebay these days)

JRC NRD-525 (highly modded, with help from Craig at KIWA. My most interesting mod was the remote controller I designed & built from a small desktop calculator. It was connected to the rear panel via a cable and allowed easy filter, frequency, and memory channel changes. I wrote this up as a construction article in one of the Fine Tuning's Proceedings books. This radio is quite good for ECSS and SSB tuning.

Forget AM, though!

R390A (E.A.C. build)(All stock, and in beautiful shape. A full set of manuals and Hollowstate Newsletter copies came with it. Port Moresby 4890 kHz never sounded better, until the AR7030 came along!)

Drake R8 (Very capable, and also an excellent DX radio bargain these days. For a while I sold custom-machined, solid aluminum tuning knobs for these to other R8 owners. The knob was black-anodized and looked and felt like the stock one *should* have.)

Lowe HF-225E Europa (A DXing wolf in sheep's clothing, but could have used PBT and a notch filter. Built like a tank, and shades of things to come (the AOR AR7030) from the same designer, John Thorpe.)

Drake R-7 (Best PBT control ever made, IMHO. I really liked the R-7 for "hands-on" feel, when fitted with the replacement knobs from the Drake R-4245 commercial receiver. My favorite rig from the 1979/80 era)

AOR AR7030 (I had one of the first units sold to the US, and wrote an extensive review of it for ODXA, NRC, and IRCA. My favorite all-around DX receiver, despite some operational quirks. My review of this is also online at: http://espresso.ts.uvic.ca/ My first AR7030 was very modded, mostly with Kiwa PFM filter modules. My current AR7030 was acquired in an unusual way-- as an almost-complete set of parts & populated PCB boards through an Ebay auction! The former AOR repair facility in the US was auctioning this nearly complete "kit" of AR7030 items. It worked fine after assembly with some help from Richard and Mark at AOR-UK. My total investment was just $320 for this AR7030, still currently owned.

Tentec RX-320 & ICOM R-75: recently acquired both of these, but haven't had much opportunity to DX with them due to work obligations and a move to another city. The fact that the AR7030 and these two rigs can be controlled by ERGO is a plus for me. I plan to use the RX-320 with a dedicated (old) laptop running Nick Hall-Patch's "DX Radar" MW DX scanning program.

Whew... you asked for it, Phil! Of all the former receivers, the one I *really* wish I still had is the Drake R-7.

hi Bob:

you're correct, the IF changes with mode:

SSB 455.0
CW 455.9
RTTY 456.0
S/AM/FM 450.0

AFAIK the flutter on SSB occurs due to leak of the other sideband. try this: change your wide SSB filter to 15 kHz / 6 kHz and tune a strong MW station on SSB. now change the frequency in 1 Hz steps. you will hear "flutter" until you are exactly centered. this is the ECSS tuning trick: now you just switch back to the dual 2.4 kHz filters and you're set. the murata filter will flutter like this on SSB. this flutter can be minimized on USB by turning both IF knobs to the left (or to the right on LSB). not ideal but useable.

regards,
phil :)

hi Guy:

thanks for interesting post! the Kiwa audio mod AFAIK replaces capacitors in the audio section. i may ask Craig if he will offer my fidelity mod. he may even want to add the switch noted in the PDF. the fidelity with the 47k-ohm resistors and the 15 kHz filter is pretty incredible on medium wave. i replaced my 47k-ohms with 90k-ohms [so i could report the differences] and notice the fidelity loss.

> Of all the former receivers, the one I *really*
> wish I still had is the Drake R-7.

it must be a nice receiver. i've heard others say the same.

regards,
phil :)

thanks. im a little confused. some have bought the very expensive
Icom wide(3.3 khz) ssb filter to use in ECSS mode. seems like the
murata would work just as well for this? im warming mine up to tweek
the oscillator in. i have acess to lots of HP test equipment. im
going to run an audio frequency response curve on the R75 later on.BOB

Dec. 21, 2002

Hello group !

I would like to know from the owners of both Icom IC-746 and IC-R75 how the receiver compares. Is the IC-746 (Pro or NonPro model) receiver section in par with that of the IC-R75 both having Twin PBT and the 746 having an IF stage DSP? I am interested to know since I'm planning to purchase the IC-746. I am aware it is more expensive but again the 746 covers 2m up to 177Mhz plus the HF and MW band. I want the opinions of owners of both radio if this is a good choice (the 746) for MW DX listening. Initially I wanted to get the IC-718 because it is cheaper but I opted for the 746 since it has a wider frequency coverage (both TX and RX).

Thanks in advance and Merry Christmas !!

Dennis Ls. M. Cruz (stclaire@...)
the Philippines

P.S.

It is a bit difficult for me to get HAM radio equipments here in the Philippines specially "new" models like the 746 and IC-R75 (almost impossible to find here). The IC-718 is currently available here for about the same price as there in U.S. but without the free DSP options. However Hong Kong is very near and prices there are way below than in U.S.

Hello everyone! I've been absorbing for about three months and I bought my R75 two months ago. Love this radio! I put the "Philter" in it but no other mods yet> I'm considering Kiwa sometime in the future.For years I've been using a RadioShack DX400 along with an Icom PCR-100. This R-75 has been so enjoyable I don't listen to anything else.Shortwave,Hams,Rtty, CW, Military and commercial air.....I'm having a ball!
Listed below are the "tools" I'm using with my R75:

Computer- Toshiba satellite 4000 266mhz with 160megs

Software- Scancat Gold, RS-R75, SmartIcom(the best!), Tcl/Tk, MMTTY, CWget

Antenna- a broomstick(165' of 16 wire wrapped on 3/4" pvc with a 10" alum top hat, an inverted L 35'long wire,and a loop around the ceiling, a cold water pipe ground. Condo living is good except it's antenna challenged.Also got a MFJ 1045c preselecter.

So there you have it!

Thanks to everyone for enhancing my R75 experience and have a fine Holiday season!

John

3287. R75 software?

Greetings, I'm blind. I received my r75 via UPS yesterday. Does anyone know of any software for the r75 that will allow me to access the filter setup and the set mode? It looks like the Smart Icom control software won't allow me to do this. I ask someone about this who has the Smart Icom control software and this is the reply:

No, you can?t access the filter setup. You can set the radio to automatically select Narrow, Wide, or Normal for USB, LSB, AM, CW, and RTTY when the Auto button is selected
on the software generated radio faceplate.
Neither can you access the set mode. All you can do is select between Ant 1 and Ant 2.
Sorry.

This unit sounds great!!!...but....

I contacted seller who says he will eventually separate if pair doesn't sell in this auction. He previously received an offer of $425 for the MAP unit alone, which he refused. He says he wants over $500 for the MAP...YIKES...even if this is a last in a life chance, this may be out of my reach. But, I guess a comparable Sherwood unit sells for $575. Consider that "Passport to World Band Radio" recommends the addition of a Sherwood (or MAP equivalent) unit to remedy synchro lock shortcomings on many radios, even very high-end models. Maybe I should bite the bullet and buy it. As you mention Guy, this MAP unit surpasses the Sherwood in quality, and only 50 were made!

Hi Carl,

The value of the MAP unit is related to a supply-and-demand situation like other products. There are very few people, relatively speaking, who know about this former KIWA product. Of those few, a small percentage may be willing to pay $500+ for one because they recognize its capability and collectability. I seem to recall that the MAP sold for approx. $400-450 when it was in production. For the masses who don't appreciate it--or the SE3 for that matter--they might see it as a gadget with <$100 value.

There are other niche radio products out there which are quite collectable--does anyone else in the group know about the John Leary-modified Hammarlund SP-600's? This fellow, before his untimely death, rebuilt SP-600s from the stripped chassis on up, and hotrodded them to a high degree. Even individual gears in the gear-train were lovingly disassembled, polished, and reassembled. He also had a flair for Mardi-gras style paint jobs; it is quite a sight to behold a hot pink, neon blue, and fire-engine red SP-600, both inside and outside the cabinet! These unusual sets, probably only a few dozen in existence, have a higher level of performance than any stock SP-600 ever had.

The MAP achieves its synchronous detection in a different, but still valid, way compared to the Sherwood SE-3. The SE-3 uses the traditional separately imposed, PLL-locked carrier which is internally generated. The MAP unit is similar to the "synchrophase" synch detection in the Drake R-7/R7a, but better implemented by Craig. This method splits the signal into two paths--the first path gets the sidebands stripped away and the carrier alone is boosted to a stronger, steady level. It then is superimposed on the original signal. The lower audio distortion is noticeable, although some would contend that the other method of synchronous detection allows signals to survive selective-fading distortion better. Craig went into great detail on synchronous detector theory in a Fine Tuning's "Proceedings" article (Maybe I can scan this in for the R75 group's file archives sometime.) In this article he describes the merits and disadvantages of each type of synchro detector, without getting into too much heady mathematics.

IMHO, the benefit to the MAP over the SE-3 is in the extra filtering and audio-shaping features, the best of which is the multiple, cascaded IF filters. Craig had his lab measurements verified by an independent laboratory (Hatfield & Dawson, Seattle), and my MAP's "Certificate of Performance" shows the following interesting tidbits (if you like reading equipment specs):

Wideband filter: -60/-6dB shape factor of 1.32 to 1
-6 dB point: 3.23 kHz, -60 dB point: 4.27 kHz
ultimate rejection at 6.0 kHz: -101 dB

ultimate IF Selectivity at 462 kHz: -88dB
passband level within +/- 2dB, 50 Hz to 3.0 kHz typ.

Narrowband filter: -60/-6dB shape factor of 1.53 to 1
-6dB point: 1.47 kHz, -60dB point: 2.25 kHz
ultimate rejection at 6.0 kHz: -108dB
Ultimate IF selectivity at 460 kHz: -89 dB
passband level within +/- 2dB, 300 Hz to 1.3 kHz typ.

Harmonic distortion (500 Hz, Ref. 60% modulation}: 1.25% wideband filter,
1.70% narrowband filter

Notch filter depth at 2.4 kHz: -35dB

Tone Tilt Response: variable a minimum of 16dB, 50 Hz to 2.7 kHz (indicates
a very effective tone control! -g.a.)

When you consider that the wide & narrow filters can be cascaded with your
receiver's stock filtering, this adds up to a very good combination.

I hope others have not considered this off-topic. Although there are few of
them around, the Kiwa MAP can be used with the ICOM R75 as a good accessory
to improve reception. For some time Craig was looking into offering a "MAP
II" which would have two choices of synchronous detection built-in, but he
never brought this device to production.

Thanks for the kind words, Ed.

tk75 free software provides control of virtually every Set Mode adjustment. A filter menu and filter configuration applet manages installation of optional filters and clearly associates IF filters with wide, medium, and narrow selectivity settings for each mode.

However, tk75 is highly graphic and I don't know that a sightless person would be able to use it. Screen snapshot images may be viewed here:

http://parnass.com/tk75/screens.html

You can learn more about tk75 and download it free from http://parnass.com

3294. tk75 troubleshooting info

Yahoo group: icomr75 (2000 — 2002)
Date: 2002-12-22 04:15:06 UTC
From: Bob Parnass, AJ9S
Topic: 3294 Message: 3294

If you have a problem installing or getting one of the tk radio
programs to run, please provide this information:

1) What operating system are you using? The tk radio programs
work on Linux, MacOS X, Windows (95 and later), BSD, Unix,
and others, so I need to know your computing environment.

2) How much RAM does your computer have?

3) What is the error message or other errant indication do you see?

The most common cause of problems (over 90%) is installing
the software in the wrong folders.

Windows defaults to the wrong folders when downloading and
extracting from a zip file, so you must override the defaults and
specify the exact folders named on my web page:

http://parnass.com/tk75/dl4win98.html

Recheck the contents of your C:\tcl and C:\tk75 folders
and let me know what files and folders they contain.

Another way to run the program is to open a command prompt window
and type:

```
C:
set tk75=3DC:\tk75
"C:\tcl\bin\wish83.exe" "C:\tk75\tk75.tcl"
```

Regards,
Bob Parnass

From: just_rtfm <just_rtfm@yahoo.com>
Topic: 3289 Message: 3299

hi rezeiwer:

i only own the R75 but here is my take... first off both are nice receivers with good sensitivity and selectivity. out of the box the Palstar has greater MW sensitivity, nicer audio quality, better AM AGC, and an analog s-meter. another strong point IMO is that the R30 can be battery operated and weighs only 2.2 lbs... if my main usage was portable DXing i might be over at the Palstar board right now. negatives: no keypad, case screws must be removed to change batteries, and previous quality control issues.

IMO the R30 is missing three important features that are standard on the R75 as well as most DXing rigs: an RF gain control (sometimes critical to having the filters work properly), passband tuning (effective at rejecting noise, the R75 has twin PBT for bandwidth shaping), and a notch filter (nobody wants to listen to a heterodyne, the R75 has an automatic notch [DSP]). other features the R75 has over the R30 include: a noise blanker (depending on your QTH this could save your sanity lol), DSP noise reduction (makes dial spinning easier on your ears, especially with headphones), RS232 control (this feature opens huge possibilities), multiple pre-amps, FM (no biggy), extended coverage to 60 MHz (no biggy), scanning, squelch, and a clock. the R75 has nice buttons, display, and ergonomics.

it is important to note that the stock R75 AM section has some flaws... this makes the Palstar better on AM out of the box. fortunately, on this board, there are mods to fix the R75's shortcomings. do Rado's AM-AGC mod and Rado or John's Sync-AM mod and you will have a working synchronous detector. this feature often means the difference between being able to understand an AM transmission and not. unfortunately the Palstar has no sync and the 20 Hz tuning steps are not ideal for ECSS. do Pete's R75 MW attenuator bypass mod and MW sensitivity is excellent. there is also a fidelity enhancing mod for the R75.

even $4000 receivers have flaws: the R75's can be fixed with skill and ~$50 worth of parts (half of that is for the soldering iron). Passport (laymans guide) rated the stock R75 4.375 stars stating: "first-rate receiver for unearthing tough utility and ham signals, as well as world band signals received via manual ECSS tuning". WRTH (DX oriented) rated three tabletop receivers 5 stars in terms of overall value: the R75, the NRD-545 ($1800), and the Watkins HF-1000 (discontinued, was $3800). [FWIW my versions of these yearly publications are old].

ok, i'll stop before i write a book. either way you cannot lose.

regards,
phil :)

Hi Phil!

Great to hear from you. The broomstick works fine from the broadcast bands up to 6 MHz. When using it and switching to the long wire it out performs the long wire, maybe due to its vertical orientation or wire length. Without the top hat it's just a pole with wire on it. I'm using an aluminum screen which was a frying pan splatter screen. Need to find an aluminum springform cake pan to use the bottom out of that. Who would have thought I would be searching cooking stores for my radio hobby?

Question: Can the UT-102 voice synthesizer be completely turned off? Sometimes it gets a little annoying when switching between am, sam, usb etc.

Thanks for saving me big bucks on the 3.3khz "Philter" It helps a lot working the AM shortwave bands!

John

Great Reciever for the Price without a doubt, been using it in the shack here for a year now, ganged together with my ICOM 718 Transceiver (Same antenna) use it like the Old DRAKE TWINS! Great combination!

WB0OAF
==========

The ICOM IC-R75 Communications Receiver

The ICOM ICR-75's poor sync circuit can be improved with "Kiwa's" modifications

The ICOM IC-R75 is medium priced tabletop SW set. It does cover a bit past 50 Mhz to also catch the 6 Meter Amateur band. It uses a seperate "Floor Brick" (or is it a Wall Wart ?) supply instead of a internal supply. It seems that the IC-R75's audio is continuing the ICOM trait of poor audio, but it's not as bad as the old IC-R71 "Distortion Beast". The Sync detector also seems to be a stinker. But overall it looks like a nice set for the money.

The Twin "PBT" looks intresting. The optional DSP is the same board that goes in other ICOM Amateur sets..so it's the old AF DSP stuff. Rubber pushbuttons have been used, that seems to be the norm with ICOM these days. Of course this type of button will not hold up in years to come as air reacts to the plastic/rubber, and also the printing on these type of buttons have a tendency to wear off with only minor use..time will tell.

I do NOT own this receiver or have had a chance to play with one. Comments from others can be found below.
Davez

Mike Moore from Canada has made a purchase of a ICOM IC-R75 than had it modified with the latest Kiwa Modifications. He notices distinct improvements and here are his initial impressions. It sounds like it's worth the extra money for sure. Thanks Mike for the comments.

"The AGC fix and perhaps to some extent, the audio mod, really removes the distortion that, previously, was particularly noticable in the AM mode. Now the audio is *extremely* clear and isn't easily affected by fading signals as it was before themod. This modification is so good that the sync mod then becomes alot less important. (I'm unsure as to how much is attributable to the AGC mod and how much is attributable to the audio mod.) I tried feeding the audio into an Optimus PRO-X44AV speaker. The audio was absolutely fabulous (although only average dynamic range). The sound was full and had a good bass. Before the mods, with the external

speaker connected, the AM distortion was so noticeable as to makelistening with an external speaker unpleasant. Now, it is very pleasant."

"The sync detector now works, ie. it maintains lock. It whistles when gaining lock and whistles when it loses lock. While testing it on a *very weak* station, it kept whistling/howling (before the mod, it seemed to make no attempt to gain lock). With the dramatic improvement to the straight AM, it's now somewhat more difficult to find signals (with rapid fades) that would easily demonstrate the difference between the sync AM and straight AM. Nonetheless, in the sync AM mode, audio and especially music appeared to suffer less from fading."

"The addition of the 3.8 kHz filter is just what the doctor ordered. This is a perfect width for narrow AM/S-AM. I tried it on Radio Havana, which had one sideband being interfered with. With sync AM, the 3.8 kHz filter and the inner PBT control turned to one side, the signal came in clear and sounded beautiful. I had been considering buying another 3.3 kHz filter (many months ago, I had taken the one I had out of the R75 and put into the AR7030+) but with the 3.8 kHz filter installed by Kiwa, I have since changed my mind."

"Also, the NR now seems to work better. On this point, I'm not really sure if this is just subjective on my part or not. Before the mods, the NR seemed to reduce signal and noise in equal proportions, rendering it rather useless. Now it doesn't seem to attenuate the signal as much (or it seems to reduce the noise more) as it did before - actually making it useful. "

"Cheers! Michael Moore"

A few comments from Dan Blackburn on the IC-R75. I feel that if a "Internal Power" supply is built correctly, no excessive heat or a cheap poor "buzzy" transformers...etc...it's better inside a radio. I hate Wall-Floor Warts !!!! The internal power supply in the JRC NRD-545 is a very nice one, matched to the set perfectly (current vs heat) and is quiet as a mouse.

"I agree with many of the comments in the postings that have appeared so far, but I have a few things to add that I have found, from having owned two of these excellent receivers so far. First of all, I do not regard the receiver's external "brick" power supply to be undesirable. I have read several reviews and some of the comments in the postings on this site, which make mention of this." " "To me, an external power supply is VERY desirable for two major reasons: 1) It takes one of the main heat-generating components in any piece of electronic equipment, and moves it well-away from the sensitive circuitry inside the cabinet. This also helps remove potential hum and magnetic fields from the immediate vicinity of the receiver circuitry. 2) In the event of a power supply failure, it is only necessary to service the "brick" itself, rather than forfeiting use of the entire receiver during repairs."

"It should be noted that the external supply would likely be less failure-prone to begin with, as long as it is in a properly-ventilated location."

"Another observation I have made with regard to the R75's sync-AM function, is that it works MUCH better with signals which are lowered by the RF gain control. I have found that the sync circuit seems to be effective only on signals that "peak" below S10 on my bar-graph meter scale. In other words, by using the RF gain to suppress the signal level so that it only drives the meter to around S-7 or so, THEN engaging the Sync feature, the results are noticeably improved. Of course, the volume control must be appropriately increased due to the reduced RF signal, in order to maintain adequate audio levels, but this is a minor inconvenience. I have noticed that when the "S" character on the display is blinking, the sync detector is working and effective under the above conditions. When it is not blinking, the sync is not active and I further reduce the RF gain until it blinks on all but the received signal's peaks."

"I have also found that using Icom FL-257 and FL-223 filters, which produce 3.3 KHz and 1.9 KHz I-F passbands respectively, yield very good results and give the most available flexibility when selecting combinations for the many operating modes. For example, I have selected AM-mode filtering choices of 15/6 (wide), 15/3.3 (normal) and 2.4/2.4 (narrow) for most SWL activities."

"Finally, I have also found the R75's internal speaker to be somewhat less than adequate, so I use mine with the excellent Drake MS-8 external speaker unit. I have found the MS-8 just right for my listening preferences, and the speaker looks GREAT alongside the R75 with the receiver's tilt bail extended. I would recommend to anyone wanting to improve their R75's audio to give the Drake MS-8 a try."

"All in all, even with the cost of the added filters and MS-8 speaker, I believe the R75 to be a superior receiver, preferable in many ways to the more expensive Drake R8B, and with better coverage and cosmetics. Having owned two Drake receivers previously, as well as two Kenwoods and a Yaesu, I must say that the Icom R75 remains my hands-down favorite of them all."

A short comment from Bj?rn Danielsson, Sweden on his new IC-R75 . English is a bit broken ...but you can figure out what he is saying.

"I have one since 1 week. And I am very satisfied with it so far.Yes it has 99 mem + 2 memories for scan edge. Is not 99 enough? I think it will be nice for me. Yes it can scan between 2 freqs and memory scan and on selected memories too like the R72 did. I can?t compare it to other radios execpt for my old Icom R72. And the R75 is much better than the R72. Better sound quality, almost noting background noise on the audio. The R72 had a lot of noise. The squelch is selectable between squelch and RF-gain or both at the same time. But I have RF-gain at max and only squelch on the squelch !! :-) If you buy one don?t forget to buy the DSP at the same

time. It has Noise reduction and auto notch. I don?t know why they have it as option, it should have been in it at first."

Bj?rn Danielsson, Sweden

A note from Johan Letterst?l in Sweden on the Bandwidth scheme ..sounds like good news here ??

As for the bandwidth scheme:
The standard R75 comes with 15k and 2.4k in 9MHz 2nd IF and 15k, 6k and 2.4k in 455kHz 3rd IF.

There are one empty spare slot for both IF's. I've added a 1.9k narrow SSB filter in 2nd IF. Actually I'm considering stripping my R71, moving both the 2.4k 455k crystalfilter (Inrad FL44 substitute) and a 4k 9M crystalfilter to the R75. R75 gives you the ability to tailor each of the bandwidths (wide, normal, narrow) with any combination of 9MHz and 455kHz filters. Eg for AM I've choosed 15+6, 2.4+2.4 and 1.9+2.4 respectively.
Johan
(Thank You Johan for the information)

Johan Letterst?l in Sweden with his promised comments on his new IC-R75 . Well it looks like the audio and Sync circuit both.."Stink"..oh well so much for wishful thinking. Want the best audio , looks like the AR 7030 is still the winner on the market..A Big "Thank You" Johan for the input.......DaveZ

The following are my first impressions and comments on the R75 after about 10 hours of usage, including some comparisions with my other units, the AOR AR7030(standard w NB/notch) and the Icom R71(w/o PLAM). The review is based on PURE LISTENING (BC-stations, mostly AM) and not any scientific A/B testing. The R75 is equipped with the optional DSP and a optional 1.9kc filter in 2nd IF. The antenna is an 8 m(27ft) random wire with coax-feed and balun. For specifications and technical details, please refer to the Icom US website (link below..) or other sources.

First look:
The R75 is small and light. The look and styling of the exterior is very nice although it doesn't have the robustness of the 7030. The buttons are the "rubber-type", but feels distinct and has a good "feedback". The main dial is ok, but the R71's big "free-wheel" is still superior. Also the solid metal knob of the 7030 has a better feeling. The other two knobs are quite small and I did have some minor difficulties to operate them (big fingers?). (No rotary encoders here, Davez! ;-){Good to hear that.but if optical encoders were used I would not care....DaveZ}

On the rear you will find the ordinary connectors for antennas, PC, recorder, speaker etc. "Why didn't Icom label them?" I asked myself, until I took a close look on the serial number label! The layout is shown there!

The R75 has a traditional front panel with the "one control=one function" concept, compared to the 7030 which uses very few controls and a complex menu-system with lots of up and down toggling. The similarity to the "older brother" R71 is obvious in some cases and if you're a R71 user, the step to the R75 is a short step.

The manual for the R75 is ok (but far from the excellent 7030 manual).Schematic is not included (not even a blockdiagram).{that stinks...DaveZ}

Usage:
The first thing that 'hits' you at power up, is the display. Large, clear and with a nice background illumination. All the settings of the receiver are shown on the display. Icom calls it a "function display" and that's what it is! I especially enjoyed the S-meter with its 'peak hold'. R75 really wins here. The method of selecting bandwidth seems to be taken directly from the R71. Each mode has three bandwidhts; wide, normal and narrow. Contrary to the R71, R75 gives you the possibility to combine the filters (15kc, 2.4kc, Spare in 2nd IF and 15kc, 6kc, 2.4kc, Spare in 3rd IF) for each bandwidth and mode. Eg for AM you could set 15kc+6kc, 15kc+2.4kc and 2.4kc+2.4kc for wide, normal and narrow respectively. The filter setup is very versatile and installing optional filters are easy. But, even this, I might still prefer the 7030 with its (up to) six filters and the excellent calibration feature. I lack a wider filter in either IF (2.8-3.3). The difference is very small, but points goes to AOR.

What about the twin-pbt? Again an heritage from the R71. The difference is that R75 uses two controls (a concentric knob) for moving lower and upper portion of the passband. Turning both controls togheter moves the entire passband. Works fine and it's much better than the R71 PBT. The 7030 uses one control and most importantly, shows the passband offset on the display. You see what your'e doing (aka WYSIWYG!).

Entering frequency with the keypad works fine, but Icom should have included a kHz button as well. To enter for example 15565 kHz, you have to punch 1 5 5 6 5 0 0 ENT or 1 5 . 5 6 5 ENT. Another ex: 1100 kHz would be 1 1 0 0 0 0 ENT or 1 . 1 ENT. Other settings (and there are a lot), such as tuning steps, beep level, cw pitch, dimmer etc, are done in a setup menu. Very user-friendly and easy to use!

The performance:
Audio: The R75 has a SMALL front mounted speaker (Icom US webpage calls it large!). The audio output and fidelity are ok and with headphones it's even better. I've not tested any external speaker. In general the audio is clearly better than the R71 (could it be worse?) but still not better than the 7030 (could it be better?). Distorsion shows up when using very narrow filters in AM, but that's logical and and could be remedied with the pbt. One way of getting nice audio is to use synchronous AM. Turning this on, the R75 will disappoint you! Honestly, I CANNOT hear ANY difference orimprovement AT ALL! In fact, under certain circumstances, the s-AM will instead momentarly distort the audio! Very strange! Do I use it the wrong

way or?...I suspect that Icom employs "carrier reconstruction" rather that "carrier replacement" for the R75 s-AM solution. The s-AM on the 7030 is superior and more versatile by all measures (even taking the disturbing low level heterodyne in account) The attack- and decay time for AGC fast and slow seems to be right and I'm satisfied with them. {This is bad news indeed on the Sync Detection Circuit....Davez)

The optional DSP has two functions; noise reduction and automatic notch. The notch isn't operational in AM according to the manual, but that's not 100% true! Certain het's are reduced completely, others not. It seems to be some limitations within the passband (perhaps due to the notch being optimizedfor SSB bandwidths, not AM at 6kc). Well, it works to some degree. Compared to my MFJ-784B DSP, the MFJ is of course better and more aggressive in hunting and eliminating het's. The noise reduction works very well, also compared with the MFJ. The levelis variable between 1 to 15 (dB?) and at 5 the reduction is sufficient. Asin any DSP, you will get 'echoing' or 'hollowness', when you increase the reduction level to maximum.

I would rate the R75 sensitivity as good and high enough for serious DX-ing. There are two preamps, +10db and +16dB, that works more and less over the entire spectrum (+16dB mainly used for 20+ MHz). Judging from S-meter readings and assuming that both S-meters are correctly calibrated (YES I know, this is not the right way) the R75 with preamp 1 equals 7030 w/o preamp on shortwave. With preamp 2, the R75 exceeds the 7030 with preamp. On mediumwave, the 7030 is better overall.

At a glance review, 1-5 (bad-excellent):
Price/performance: 5
Design: 5
Controls: 4
User friendliness: 5
Sensitivity: 4
Features: 4
Specific functions/features:
Filters: 3-4
Sync-AM: 2
DSP: 4
Setup menus: 5

Johan Letterst?l, Sweden

Comments from James in Taiwan, edited from the "Newsgroups" . True, the price has to be looked at, but if you like better audio and a sync circuit that actually works (at least at this point it does indeed looks like the R75's sync...stink ?)..spend another US $ 300.00 and go for a "Standard" version AOR AR7030. If "Sync" is not on your list of "Must Have" then maybe a R75 would be a good buy ??

I just got an IC-R75 after reading some reports both pro and con about the receiver. After using the receiver I found out that most of the cons were over rated. When using this radio keep in mind the price it cost. An IC-R75 IS NOT an IC-R9000 or anyother US$5,000+ radio. My IC-R75 is replacing my IC-R71A. The R75 is FAR BETTER that my R71A in all functions.

The size of the R75 is just right as it can be used as a portable receiver in a car without making any big changes. ICOM has choose to use hard rubber for the buttons and tuning dials. Some people on the net feel the hard rubber will get eaten away over time. I think there is some truth to this but under extreme temperture contidtions. The R75 is very light (My R71A was a ton!).

I must tell you that I put the DSP option in the radio and it works very well. The key to listen on the R75 is not to set the NR (noise reduction) level too high. If the NR is set too high you will get distortion at voice freqs. It a few cases I was able to masking / cover a voice completely by setting the NR very high. It's just a good ideal to set the NR to the maximum noise reduction level and not above.

The NB (Noise Blanker) is of great help. In some cases it kills more noise than my IC-R8500 with a DSP 599zx! I live almost under power lines and I night I get very bad bus noise fro the relay stations. With the DSP option the NB works very well (The NB doesn't work in FM mode).

I found the two level preamp VERY usefull in low signal conditions. Here in Asia we have to fight with noise a lot more that US or Europe based monitoring sites. In one case I was able to pull out a very low powered Mongolian station out between a radio station in Shanghai and Helongjiang in Northern China! I use the NR and ANF (Automatic Notch Filter) to peek the voice level of the announcer along with the TWIN PBT (Passband Tuning Controls) to adjust the level of IF to give me the maximum audio level (this TWIN PBT wasn't a great help in AM mode but it did help!).

The memory bank space on the R75 is just too small. I don't know what came across the folks at ICOM by putting in ONLY 100 slots for programming. This is a major drawback. Because of the low memory banks I've started to use a PC control software to do large band scans. ICOM messed up here big time!

I found the scanning rate as fast as my R8500 and R7100 and the hit rate just as good.

The CW audio pitch adjustment also works well and saves me time when decoding via my external noise filter (Timewave DSP-599zx) The RTTY reverse mode helps me a bit when I screw up the MARK and SPACE signals. Also being able to select the RTTY shift helps when tunning a known RTTY signal.

Comments below from Gert Nilsson from Sweden on his IC-R75 . Thanks Gert for the input.

Some weeks ago I bought an IC-R75 with the 2,8 and 3,3 kHz filters and the DSP. Price around 9000 SKr = 1000$. We are some guys in ?rnsk?ldsvik using 6 very long beverage antennas at a very quiet QTH. My friends have NRD 515, AOR7030+ and NRD525 receivers and I have made some tests. COMPARISON between R71E and R75 R71 with PLAM, 1024 memory board and some extra filters, attenuator below 1,6 MHz removed.R75 with DSP, 2,8 kHz filter in 9 MHz IF, 3,3 kHz filter in 455 kHz IF, AM band attenuator shorted out.These two receivers are rather similar, if you are used to the R75 you will enjoy tuning the R75. If you do not like the menus/remote control of the AOR AR7030+ the R75 is a receiver for you.

Sensitivity:My R71 is as sensitive as the AR7030, NRD515 and NRD 525. The R75 is even more sensitive. I have tried stations down in the noise and you definitely here them first on the R75. It has 2 different preamplifiers: Preamplifier 1 uses 2 JFET in parallel in a grounded gate configuration and I still have to se it crossmodulate. Preamplifier 2 can be used on all bands but it is intended for low noise operation above 20 MHz. It is an broadband IC amplifier with almost 20 dB amplification and very low noise, but it can not be used on crowded bands like the AM band during evening and night hours. It is perfect in a low signal environment. The specs for the R75 says 5,6 uV for AM below 1,6 MHz. With the attenuator removed it is very hot down to the lower frequency limit. ICOM has made a CP = Connection Point on the main board. If you short this connection point the attenuator is removed.The R75 has very quiet AF amplifiers, no broadband hiss like the NRDs which make readability of weak signals better.

Selectivity:The R75 has 15 kHz filter in the 9 MHz IF ahead of the Noise gate, then follows the other 9 MHz filters, 2,4 kHz and one optional. Third IF has 15 kHz and 6 kHz filters with 450 kHz center frequency (very cheap Murata filters) and a 455 kHz Murata CFJ455K5 2,4 kHz in other receivers but just 2,1 kHz in the R75. Any mode can use 3 different settings: narrow, normal and wide and you can choose yourself. The only limitations are that you can not use the 455 kHz filters in the S-AM (more about that later). Selectivity is very good. My 3,3 kHz filter has very steep shirts.

Passband tuning:The PBT of the R71 adjusts the width of the filters, if you do not have a wide extra filter in the 9MHz IF or bypass these filters. The R75 has twin PBT with 2 concentric knobs. If you turn both the same amount in the same direction you just move the passband, like the Drake receivers or the 7030. You can move it +/- 1,29 kHz in 15 Hz steps. If you turn one of the knobs or turn the knobs in different directions you can tailor the bandwidth and move the position of the passband simultaneously. With the 2,8 + 3,3 kHz any bandwidth between 1,5 and 2,8 kHz is possible. This is similar to the NRD535. I think the PBT works great. It works best with the optional 455 kHz filters.

Frequency control:The R71 has 10 Hz, 50 Hz (when tuning fast), 1 kHz and 1 MHz steps. The R75 has fine tuning of 1 or 10 Hz, coarse tuning selectable 0,1, 1 , 5, 6.25, 9, 10 12.5, 20, 25 and 100 kHz and band tuning in 1 MHz steps. You can have different steps in all modes. Tuning accuracy:The R71

tunes in 10 Hz steps and a has 10 Hz accuracy if you have PLAM and learn to count the marks on the tuning control. The R75 tunes and shows 1 Hz. The only indication of correct tuning is by ear so I would say 10 Hz is a realistic accuracy. My R75 shows the correct frequency at 500 kHz but is 15 Hz high at 30 MHz. I have not tried to correct this.

Stability:The R71 drifts about 60-70 Hz from turn on. The R75 drift is within 10 Hz.AM/S-AM:Of course much better audio in the R75, but I can't see any major difference between AM and S-AM. Icom uses a Stereo IC to restore the carrier. Not close to PLAM. In fact the R75 sounds so good in USB/LSB I always receive AM stations in the SSB mode with 2,8 or 3,3 kHz filters. The DDS is very clean and the audio is very clear and open in SSB. If you have 2 or more stations on an AM channel it is much easier to separate them with the R75. I think ICOM should try another solution to synchronous AM, preferably with a small lock in range. If I have 2 stations 50 Hz apart I can lock on either of them with the R71 PLAM which functions very good.

Noise blanker:The NB works fine on impulse noise on both receivers. The R71 NB is adjustable the R75 is not. The R75 NB also distorts strong signals (when it is not needed).

DSP:The NR can be adjusted between 0 and 15. A setting of 3 to 5 works fine, but I personally think it is a disappointment. When you press the NR button it sounds very good when the noise drops a lot but in fact all audio get weaker so the difference is just a few dBs. Still it can make the difference when signals are very weak. Like all kind of DSP the sound is a little strange to listen to. The ANF, the automatic notch filters, is quite good and eliminates most heterodynes, very easy to use.

Crossmodulation:No problems unless you use the Preamplifier 2 on crowded bands .

Not so good:The concentric knobs for the Twin PBT are not very easy to use with big fingers like mine. The pressure needed to push a button is a little to much. I like the R71 much better.

Recommendations:If you like to tune to hard to get stations on crowded bands I think an extra filter in the 455 kHz IF is a must. If you have to compromise I think a 2,8 kHz filter is a good compromise. At 50$ the DSP is clearly worth the money. If you are a BC DX-er you should try to remove the attenuator. If you have troubles with local stations it is very easily restored to the original.

3302. Re: [icomr75] Heres a Review for everyone I ran across

Yahoo group: icomr75 (2000 — 2002)
Date: 2002-12-22 18:06:42 UTC
From: John Pickrell
Topic: 3301 Message: 3302

To All,

I culled this paragraph from The Internet Repair Shop's" reviews in an earlier email and would like comments and observations on its accuracy.

"Another observation I have made with regard to the R75's sync-AM function, is that it works MUCH better with signals which are lowered by the RF gain control. I have found that the sync circuit seems to be effective only on signals that "peak" below S10 on my bar-graph meter scale. In other words, by using the RF gain to suppress the signal level so that it only drives the meter to around S-7 or so, THEN engaging the Sync feature, the results are noticeably improved. Of course, the volume control must be appropriately increased due to the reduced RF signal, in order to maintain adequate audio levels, but this is a minor inconvenience. I have noticed that when the "S" character on the display is blinking, the sync detector is working and effective under the above conditions. When it is not blinking, the sync is not active and I further reduce the RF gain until it blinks on all but the received signal's peaks."

Thanks.

Completely wrong. When the "S" blinks, the radio has switched to AM
mode and is not using the sync detector.

There may be more merit to the fact the AGC may (or may not) behave
differently under these circumstances. This could give the impression
that the sync detector is working. Rather, the AGC may be performing
better.

Craig

Craig,

That was my observation and the manual "almost" says that.

Completely wrong. When the "S" blinks, the radio has switched to AM
mode and is not using the sync detector.

There may be more merit to the fact the AGC may (or may not) behave
differently under these circumstances. This could give the impression
that the sync detector is working. Rather, the AGC may be performing
better.

Hello Group,

I've been lurking here on this group for a few months now, reading everyone's posts regarding the problems with the R75 sync detector. I have an un-moded stock R75 that I've owned for almost a year now and I can verify that John is correct when he said that the synchrounos detector IS FUNCTIONING when the S-AM indicator is blinking. This how my unit has always worked right out of the box without any mods. The R75 manual says this on page 14.
Here's how I discovered that the sync-am works right out of the box: I used my radio for about 3 months with a 90 ft. random wire which runs around the outside of my house with a coax lead-in and grounded with an 8ft ground rod right where the coax feeds into my home. I was getting pretty good dx results with this setup but was considering doing phil's sync and agc mods because I wanted to get sync-am working to reduce the fading. Then one day as I was re-reading the R75 manual, I noticed that it said on page 31 that the sync detector works when the signal level is poor. I thought about it and wondered if reducing the RF gain to simulate a poor signal would make a difference and lo and behold it did! I discovered that if I tuned in a fairly strong signal that was fading in and out and then pushed the AM button so that S-AM was displayed solid, then reducing the RF gain slightly 1 1/2 to 2 hash marks to the left, the "S" started blinking and the fading was almost completely eliminated. I then raised the AF volume control slightly to compensate. When I returned the RF gain to full, the station started fading again. I would have to admit that I discovered this with almost no help from the R75 manual. There is only that slight hint on page 31 that mentions the Sync detector works only when the signal level is poor. It is easy to come to the conclusion that the S-AM is non functional when you press the button and nothing happens. I assume that 99% of R75 users have come to this conclusion thus giving the R75 such a bad reputation as far as sync-am is concerned. Let me say that I think the R75 is a fantastic radio which I love to listen to and operate.
I started out with a Sangean ATS-909 which is pretty good, but the R75 runs circles around it even using the same outside antenna.

I would like to hear from anyone who has a stock R75 and can reproduce these results on their radio. Perhaps Icom really did include a working sync detector in the R75 but failed miserably to describe how to enable it in the manual.

Best Regards and 73's

Stan Tyks
Santa Cruz CA.

My "S" bar graph goes UP when I turn the RF gain control down (CCW), Hmm... I have the 2.1 mods. When the S in S-AM is blinking the R75 is definitely loosing lock as indicated by the growl.

The only way I can get the S to blink on a strong station is to detune.

Bill,

Be sure you have the AGC turned on when you lower the RF gain.
Or possibly your radio may work differently with the mods installed.
My R75 performs as John Pickrell describes but it is a stock radio with no mods.

Hey Guys,

Before I get praised (or tarred and feathered) all I did was copy a paragraph out of a review. I've read the manual: page 14 says: ""S-" blinks when the automatic mode selection between S-AM and AM modes is in use. Page 31 says: "The S-AM mode can be detected with the standard AM detector automatically when the signal level is poor. (En)"

This (kinda) implies that when the "S-" flashes the S-AM detector is activated. I've not been able to tell so far. We need a definitive answer.

Anyway, if there are any "Kudos" out there I'm not the one who deserves them.

Topic: 3301 Message: 3310

This means the S-AM circuit is switched off when it blinks and the common AM detector is switched in when signals are poor and lock is lost. The fact that it sounds better when RF gain is reduced is that a steady DC level is applied to the AGC line and override the derived AGC. This is a good way to get better reception when you have fluttering signals. Even better if the AGC is turned off.

By the way my meter also rise when the RF gain is turned back. All Icoms I have used operate like that.

3311. Reading the manual-very necessary

Yahoo group: icomr75 (2000 — 2002)
Date: 2002-12-23 04:10:35 UTC
From: k8dxn <k8dxn@charter.net>
Topic: 3311 Message: 3311

Well I just deleted the script of what was to be a post on strange things happening with my UT-102 in my R75. I was taking notes on what was happening with it when I decided to reset the processor thinking that was necessary. While looking the procedure up in the manual I came across the set menu and found the answer to my "problem". My unit was reading out the signal strength and I have never had a module do that before. Man these thing are cool! I am going to look up the set menu for my 746 Pro and see if it does that in that rig as I have a UT-102 to install there also . I disabled the s-unit announcment as it is at the start of the announcement and I would rather hear the freq. first. Just thought I'd share my experiences of being a "newbie" to the R75. When in doubt read the manual, twice even to get the wording correct as sometimes the translations are different depending on where you live. I wish all a very safe and happy holidays, Rick.

3312. ¡Keep the good work and Happy Holidays

Topic: 3312 Message: 3312

Well, greetings from Panama.

I am glad Mr Parnass appears here (pls, pardon my english writing). He usually is read on the icom r2 page, which I belong to.

I do not have an icom r75. I pray, first, to get the money and, secondly, to buy the best radio I can with that money. This is the reason why I keep reading this column. And I think Icom R75 is indeed a very good radio and, after mods, an excellent one.

I am own a Yaesu FRG-7. I feel glad about this radio is very good. ¡We can not get better things from the past! I have owned the Grundig Satellit 600, the Hallicrafter SX-130 and all of the Sony portables radios, except the SW-77. And the Yaesu is still something good in many ways, except for the IF bandwith filter. Which I have not been able to change, yet, because I do not find it. I was told a Murata CFM455I will do the job.

Somebody else wished to know about the rating of another icom. A transceiver. You all can go to eham.net There, in product reviews, you can find many good answers.

Happy Christmas and New Year to all, especially Phil and Guy. I wish I had their talent with radios. But I had to be many things in life after my devotion for radios.

God bless all of you for the good will you have.

Take care,

Carlos Vargas Vidal

Well,

I got the radio Friday, and they DID do it for the $439 price after $60 gift certificate, so I only paid $450 total! The DSP unit is on back order so I will have to wait a little bit on that side of it. Rick, did you have to wait for your DSP?

I have not had a chance to play with the new toy yet. Saturday was my oldest daughter's 3 year B-day so that took ABSOLUTE precedence over the radio. Quick question for the group: where are you getting the "desk/consoles" that you use for your radios? I have seen lots of pics in various radio mags of stations with multiple "shelves" for the radios yet still have room for writing, working, etc.

Glad to FINALLY be a true member of the group!

Scott

3315. Kiwa Mods Filter Setting

Yahoo group: icomr75 (2000 — 2002)
Date: 2002-12-23 10:35:45 UTC
From: woody07823 <freilich@pica.army.mil>
Topic: 3315 Message: 3315

Hello all,
I've had my R-75 for about a year and after recommendations from this group and other news groups had the Kiwa Mods done.
I was listening around yesterday and got to playing with the filter setting menu on the radio. Guess I shouldn't have done that because now I have no idea if I changed them or not.
Could some kind soul give me the setup for best performance (as it should appear on the R-75's display) of all the filter settings with the Kiwa 3.8 in place.
Sorry for such a stupid question but this filter thing really has me confused.
I don't understand why there are 2 settings for each mode.
Thanks in advance,
Lenny

3316. Filter Settings-- Guidelines?

Yahoo group: icomr75 (2000 — 2002)
Date: 2002-12-23 13:22:14 UTC
From: Guy Atkins
Topic: 3316 Message: 3316

I've seen a lot of questions on the R75 group about "proper" setting of the filters at the 9 MHz and 450/455 I.F. stages.

Perhaps there exists, or should be developed, some simple guidelines for filters in the receiver? For instance, as I understand it, most receivers with multiple stages (I.F.'s) of filtering begin with wider filters and then progress through narrower filter in the signal chain. If this is generally true, then a radio hobbyist who has a basic understanding of effective bandwidths (ie., 2.4 is very narrow & muffled for AM audio, but it's a nice wider BW for SSB, AM sounds rich and full at 6 kHz and above, etc.) could consider the filters in his R75 and easily determine the settings for each mode.

If a simple guideline or "rule of thumb" was available for determining the filter settings irregardless of the array of optional filters installed in an R75, then that could make it a lot easier for individuals to configure their ICOM.

Am I dreaming here, or is there actually some rhyme or reason behind "proper" filter arrangments? I know that cascaded filters in Lowe & AOR receivers, as well as Kiwa's filter modules use progressively narrow filters in the signal path (even if all filters are at the same I.F.). In the R75, when there are multiple, wider filters in the stages above the final I.F., I think it's better to choose the narrowest of the wider filters. That is, if the final filter is 2.4 kHz, and there are 15 & 2.4 kHz filters available before the final I.F, then choose the 2.4 rather than the 15 kHz filter for the best selectivity.

I'm not implying I have the answer here, just that there ought to be a plan that anyone can follow. The bottom line should be achieving a mode-appropriate final bandwidth, resulting in the best shape-factor and ultimate-rejection figure possible.

From: theshopt <theshopt@yahoo.com>
Topic: 3317 Message: 3317

```
================================================================
Does anyone know of anything available in the GRAPHIC EQUALIZER area
allowing only the voice spectrum to be tailored for Super Quality
sounding audio? I Know Phil came up with the Audio Filter which I did
and really like and highly commend him for that project.

Now the next step, being a Ham, I hear Sub-Audible Tones being send
for CTCSS Squelch on some 10 Meter repeaters.

Also wanting to apply a design and/or Product to create/purchase a
BANDPASS/BAND REJECT Audio filter to Taylor the Audio on all my
radios, not independently, but as a whole.

My Idea is a 35 Watt Audio Amp (which I have) running the Audio from
2 R75s and 3 Scanners thru a Mixer/Equalizer, perhaps a 5 BAND EQ
would be sufficient or maybe more is needed?. Then run the processed
Audio from the EQ-ED Audio to the input of the 35 Watt Audio Amp to a
Super Quality Speaker. The MASTER Volume Control could then control
all 5 Receivers (or more) without having to adjust ALL the recievers,
but only once for a favorite listening level. The MASTER would then
either Turn everything up or Turn everything down.

Wonder if anyones's experimented with anything like this? Been
thinking about it for a while. One area I'm really interested in is
HISS LEVEL Elimination, without taking any voice out.

Perhaps coming directly off the Discriminator with a LINE-OUT is a
Solution? Most of the Audio Amps in all recievers seems to be of poor
design looking at the schematics. It might be worthy to Grab the
Audio right off the reciever before it gets to the interal amps.

Also the SUB-AUDIBLE Tones on my Scanners are annoying if the
scanners are pugged into a lager speaker or good enclosure. The
cabinet themselves resonate the tones! Some inout from you
experimenters on this fine group would really be interesting! Keep up
the good Projects and goos DX-ing!

Hello fellows - yes, this is factual. Even with the S-AM off, the AGC is greatly improved (and thereby the signal as well) with the RF gain dropped a bit.

3320. Kiwa MAP Accessory Now a Separate Item on Ebay

Yahoo group: icomr75 (2000 — 2002)
Date: 2002-12-23 19:37:27 UTC
From: thinkdx <dx@guyatkins.com>
Topic: 3320 Message: 3320

A follow up to an earlier posting of mine:

The seller of the R-71a / Kiwa MAP combo has taken my advice and separated the equipment. The MAP unit alone is at the following web address:

http://cgi.ebay.com/ws/eBayISAPI.dll?ViewItem&item=1947238344

This is a 3-day auction, so I think it'll probably go for less than its worth. It would be a nice item to have with the R75 or any other 455-kHz I.F. receiver.

Besides the cascaded I.F. filters, audio controls and synch AM detection, the MAP accessory contains an excellent speaker. Craig at KIWA tested many different speaker samples for distortion levels, etc. before settling on a particular model to build into this product. I remember being in his shop in 1989 when he was doing audio analysis on a batch of various manufacturers' samples; his high quality standards really left a good impression on me! The MAP unit has an A/B switch to compare raw audio with the processed signal from the MAP.

When I finally get some chores and remaining unpacking out of the way in our new home, I look forward to trying my own Kiwa MAP accessory with my AR7030 and modified R75. I wonder which one will benefit most from the synchronous AM detection & extra I.F. filtering the MAP provides? It's *really* a shame that Kiwa doesn't make this product any more! It's useful for both the DXer and program listener. It was just too expensive to produce (new price was approx. $450 if I recall).

The nearest competitor to the MAP is the Sherwood SE-3; a fine device that improves even venerable receivers like the R390A and WJ HF-1000.

Hi Bob,

The trith:
- When the "S-" is blinking the audio is taken from the standard AM detector.
- When the "S-" is steady the audio is taken from the synchronous AM detector.

It should be noted that the "standard" AM uses pseudo-synchronous detector (this is good). The difference in audio quality between the S-AM and AM could be noticed only on selectively fading or very weak stations after the modifications are done.

Regards,

Rado

3327. FW: [icomr75] Filter Settings-- Guidelines?

Yahoo group: icomr75 (2000 — 2002)
Date: 2002-12-24 01:44:24 UTC
From: Guy Atkins
Topic: 3327 Message: 3327

I've seen Phil's matrix of filter choices...a well-presented table of choices.

However, my posting was mainly inquiring about a simple *guideline* for cascading filters, and I suppose such a rule or rules would work with any receiver that allows independent, chained or cascaded filters. Another way of
looking at it: what criteria to receiver designers use when the cascade filters one after the other? How do they decide on the size & order of filters as optimum for a particular mode (SSB, AM, CW, etc.)?

Guy

Blinking = Normal Envelope Det and trying to aquire sync lock
Non Blinking = Sync Det

The person that posted that these discoveries were made reading
the manual misinterpreted what the manual is saying. On page
14 it says that it blinks when automatic mode selection between
S-AM and AM is in use. This means it is attempting to aquire
sync. When it locks (is syncronized) the blinking stops.

On page 31 under S-AM "En" it states that the standard,
i.e. envelope detector, is used when the signal level is poor.
This means that when the signal level is poor that there is
provision for dropping back to the standard envelope detector
since lock will probably not be possible in this condition,
prior to any mods that is. Therefore the manual is stating
just the opposite of what the other poster was saying. Since
sync det works poorly if at all under poor signal conditions
ICOM set it up to automatically mode select back to envelope
detection, as long as you choose the "en" selection.

Other posters have pointed out that what they're observing is
better AGC action under this condition since without the AGC
mod it works better turned off in this case. What they're doing
is effectively turning it off by reducing the RF level to the
point that it maxes out the AGC.

jazzer

Hey jazzer,
How about explaining why my S meter goes up when I turn the RF gain down
with my 2.1 mod R75? I would expect just the opposite.

hi Russ:

what you're noticing is normal. as i understand it, the s-meter readings only represent signal strength when the RF gain is at the 12 o'clock position. apparently the CPU sets the meter according to how much RF gain is applied instead of true signal strength. weak signals need more gain so the s-meter is moved left. strong signals need less gain and the s-meter is moved right. when you manually turn the RF gain to the left you limit the gain applied and the meter goes to the right as you are really looking at gain applied, not signal strength. [any corrections welcome].

regards,
phil :)

3336. RE: [icomr75] Re: Reading the manual-very necessary

Yahoo group: icomr75 (2000 — 2002)
Date: 2002-12-24 05:02:51 UTC
From: Guy Atkins
Topic: 3311 Message: 3336

Russ,

Hopefully I'm not adding to the confusion on the AGC and S-meter issue, but here's my understanding. When you turn down (reduce) the RF gain, the needle rises and indicates the relative signal strength needed to bump the indicator higher. That is, with the gain at minimum (turned all the way down) the "plus sixty" reading shows you that a VERY, VERY strong signal of greater than plus 60 (+65db for instance) would be needed to move the needle at all. So, if you want to find only stations coming in at the common, strong signal strength of "S-9", start out at a quiet place on the bands (between signals) and turn the RF gain down until the meter indicates S-9. Then tune the receiver and any signal that moves the needle (or bar graph, in the case of the R75) is greater than, or equal to, a S-9 level.

Does this description fit anyone else's idea of the S-meter and gain relationship?

That sounds more like what the squelch does, to me. No?
When you set the squelch level at say 7, it takes a signal with a strength of greater than "7" to open the squelch.
More confusion :~)

What you see on the meter is the voltage on the AGC line. When you turn the RF gain back a voltage is applied to the AGC line reducing the gain after the first mixer and in the IF section.

I have a strange thing happening with mine! I had a friend configure it so I can use both the rf gain and squelch. I noticed when I get a S meter reading with or without the antenna connected, rf gain turned all the way down, I get plus 60! How is it I can get such a strong signal reading with the rf gain turned down?

Good analysis Phil,
But I've never seem a radio that acted that way. I have always thought that
the S meter represents the reciprocal of the AGC voltage. If I turn AGC off,
I get zero S units.

Still confused.

As Gert say, the meter is connected to the ACG line. In this case more voltage (higher reading) means less gain. When the Gain control is set to max gain, the detected signal is used to generate the AGC voltage. The more signal, the greater the voltage. Greater voltage give less gain in the system.

The gain control adds its own voltage to the AGC line by providing a minimum voltage. The in turn implies setting the maximum gain in the system. Increase the voltage and you decrease the maximum gain.

Since the signal meter is measuring the AGC voltage and not the actual signal level it responds in an 'unusual' manner. At least, it is unusual until you understand how it works. This is also how many radios work so it can not be considered unusual.

Food for thought: On the R-75 all of this gain control occurs after the first mixer, so is it really IF gain control?

Bill, if you turn AGC off, you do get a zero reading as you are disabling the radio's ability to measure the signal and automatically adjust the gain. However, we are talking about the RF Gain control's action which is different.

I currently have an Eavesdropper-C which is basically a dipole with
inline traps. It works great!
I was thinking about putting up a random wire antenna also.
Would this improve reception in any areas over the Eavesdropper or am
I just wasting my time.

From: jazzer37_99 <jazzer37@hotmail.com>
Topic: 3311 Message: 3344

The S meter is supposed to indicate signal strength. This may
be proportional to the AGC control voltage or inversely
proportional depending on whether the voltage controlled amps have
increasing gain with increasing voltage or decreasing gain
with increasing voltage.

In the case of the R75 the gain decreases with increasing voltage.
This means that the AGC voltage is directly proportional to
the received signal strenth.

If you look at the block diagram in the files section you'll see
that the S meter is a buffered version of the AGC control
voltage. The AGC control voltage is determed by 2 parameters:
1. The output level of the AGC diode detector which corresponds to
received signal strength
2. The RF gain control voltage

When the RF gain is turned all the way counter-clockwise
the AGC control voltage is at the max which corresponds to minimum IF
gain since the gain decreases with increasing voltage. The S meter
at this point indicates max signal strength because the voltage
is maxed out due to #2 above. The output of the AGC det is irrelevant
at this point since no more voltage can be delivered from the
AGC amp since it is railed out. As you move the RF gain clockwise
from the fully counter-clockwise position you'll see the S meter
indication decrease because the AGC control voltage is going down
which is increasing the gain of the IF. Once the pot is turned far
enough such that there is no indication on the S meter the output
voltage due to the AGC detector will have a chance to dominate
(which it will if a strong signal is being received). This position
is the "normal" range of operation.

ICOM could have designed it such that the minimum gain AGC voltage was
displaced from the level required to display on the S meter but they
didn't which does make for a somewhat confusing mode of operation.
This is probably one of the reasons that Passport states in the
"Con" section that the RF gain/AGC operates peculiarly. It is also
somewhat odd in another respect but I won't get into this one for
now...

3345. S-Meter and RF Gain

Yahoo group: icomr75 (2000 — 2002)
Date: 2002-12-24 17:00:09 UTC
From: Mike Walsh
Topic: 3345 Message: 3345

Russ,

This confused me at first too. According to the "Squelch and RF gain" section on page 14 of the manual:

"The RF gain is used to adjust the receiver gain. Shallow rotation (i.e. turning counterclockwise) moves the S-meter to the right indicating the signal strength which can be received."

Apparently, as you adjust the RF Gain the S-meter switches to a mode where it's telling you the minimum strength signal you're going to be able to hear at that gain setting. As a result, the S-meter moves to a higher level as the gain is reduced.

This is true regarding the squelch/RF control on the R75. I wasn't thinking of the R75 in particular, though. Just receivers in general.

That sounds more like what the squelch does, to me. No?
When you set the squelch level at say 7, it takes a signal with a strength of greater than "7" to open the squelch.
More confusion :~)

To All,

Here is, so Gerd at ICOM thonks, is the last word. I am, personnaly, tired of the folklore and BS, received from those people and I intend to pursue this subject up the corporate chain.

John Pickrell

It reads noise in an incorrect ratio to the actual signal.....when not properly set, it means nothing to the operator.

Gerd,

Thanks for the reply. You answered an unasked question-I know, as do most other people, what the S-Meter reads when the variable RF Gain is at it's maximum position and I agree with your answer.

You have, however, left unanswered my main question. If the time left in the day does not permit the necessary research that is fine, I'd be happy to wait until after Christmas for the answer.

Have a Merry Christmas.

Gentlemen,

First, let me congratulate your engineers on a fine design and your marketers on making it affordable.

As background, I belong to a R75 users group on Yahoo and there is a on going discussion (repeatable on a six month periodic) concerning the operation of the R75's variable gain control and the resultant change of indicated level on the S-meter.

The question: "As the RF Gain is decreased the S-Meter reading increases-what is the S-Meter indicating and what (or how) does the operator use this information?"

As an engineer myself, I believe your engineers designed this feature into the radio to supply informative data to the operator and I don't believe this is a result of "that's just the way it is."

I have called your technicians on three occasions and received three different answers, at this time I would like a definitive answer. This operational characteristic of the R75 is really bothering me (and other people in the user group as well) and detracting from my enjoyment of the radio.

I will, of course, share your answer with the group.

I wish to thank you, in advance, for the time and effort necessary in resolving this issue.

My R7000 does a similar thing using the analog S meter needle. When the squelch knob is turned clockwise the needle goes to the right (higher) meaning that a signal of that strength or greater is required to "break" the squelch.

Russ, if you want to hear the "voice" without all the noise in the background, just turn the squelch till it cuts out the signal then press the lock button. The voice will give all details with nothing interfering. Turn the squelch back to normal when you're done.

From: Jim Hackett <jim_hack@yahoo.com>
Topic: 3311 Message: 3353

That's affirmative, good buddy.
Merry Christmas, Russ and all on this group!

3354. Who does R75 Mods?

Yahoo group: icomr75 (2000 — 2002)
Date: 2002-12-25 16:12:30 UTC
From: mwbryant@aol.com
Topic: 3354 Message: 3354

Greetings,

I just joined this group and I was wondering if anyone knew of any other company, besides KIWA, that will do the sync/AGC mod on the R75. I'd try them myself, but my eyesight just isn't adequate.

Any info appreciated!

Michael Bryant
Louisville, KY

Thanks, now another question.

When I press the AGC button until I hear a double beep to turn it off. When I press the AGC button to turn it back on, is it fast or slow?

Merry Christmas to you and the group,
Russ

3359. Re: Reading the manual-very necessary

Yahoo group: icomr75 (2000 — 2002)
Date: 2002-12-25 22:52:29 UTC
From: Jim Hackett <jim_hack@yahoo.com>
Topic: 3311 Message: 3359

It comes back on in fast mode.

Just to add to the confusion....

The AGC comes back on in the mode it was when it was turned off.

Could be fast, could be slow (normal). Whatever you had it set to
previously.

Craig

3361. Re: [icomr75] Re: Reading the manual-very necessary

Yahoo group: icomr75 (2000 — 2002)

From: Russ Kiehne
Topic: 3311 Message: 3361

Being blind, I have no way of reading the display. I can't hear any
difference between fast or slow AGC. I did some experimenting and it seems
the r75 doesn't really have a fast AGC. By turning down the rf gain,
turning it up quickly, I was able to determine fast and slow agc. They both
have a delay when turning up the rf gain. I like the AGC on my Satellit 800
better. This is from the
Satellit 800 specs.

AGC Performance:
Threshold: 1.0 mV. Attack Time: 1 millisecond.
Release Time: SLOW 3 seconds, FAST 300 milliseconds.
Less than 6 dB change in audio output for 90 dB RF input change
(referenced from the AGC threshold point plus 3 dB).

On my Sat800, I can hear the difference between fast and slow agc. Does the
Kiwa mod take care of this?

That's what I found out! This is a reply I sent previously.

Being blind, I have no way of reading the display. I can't hear any
difference between fast or slow AGC. I did some experimenting and it seems
the r75 doesn't really have a fast AGC. By turning down the rf gain,
turning it up quickly, I was able to determine fast and slow agc. They both
have a delay when turning up the rf
gain. I like the AGC on my Satellit 800 better. This is from the Satellit
800 specs.

AGC Performance:
Threshold: 1.0 mV. Attack Time: 1 millisecond.
Release Time: SLOW 3 seconds, FAST 300 milliseconds.
Less than 6 dB change in audio output for 90 dB RF input change (referenced
from the AGC threshold point plus 3 dB).

On my Sat800, I can hear the difference between fast and slow agc.

3363. Suspicious Diode in MW Bandpass Filter Section

Yahoo group: icomr75 (2000 — 2002)
Date: 2002-12-26 03:04:18 UTC
From: thinkdx <dx@guyatkins.com>
Topic: 3363 Message: 3363

Hi All,

I've taken some time after Christmas dinner to sneak up to the radio shack and investigate the problem in the MW bandpass filter section of my recently-acquired R75. I discussed this difficulty (virtually zero signal below 1.6 MHz) in the group previously.

I seem to have isolated a suspicious part-- diode D172 at the output of the bandpass filter. It's a Matsushita MA77 VHF/UHF switching diode. When I connect a 20-ft. length of wire (via a capacitor) to the cathode of D172, I get a S9+30dB signal on 1450 kHz (a nearby local 1 kW night-time station). When I touch the same wire to the anode side, the signal barely registers S1-2 on the meter.

It's possible it's a cold solder joint or slightly misaligned part (partial or open circuit), as under magnification the diode looks to be tilted or askew.

However, if this is a defective part, what might be a suitable replacement in a leaded component that I could locate easily, such as at a Radio Shack store?

I've worked with germanium small-signal diodes before in crystal radio projects, but I have little familiarity with switching diodes.

Thanks in advance for any part numbers or substitutes that could be suggested.

I'm going to take the radio into my workplace tomorrow so I can look at the part under the stereo microscope we have there for SMT work.

Guy Atkins
Puyallup, WA USA

While you are correct that it is difficult to quickly discern fast from slow AGC on the R75, it is easy to tell when the AGC is off. The sound level rises sharply, almost painfully. Hitting the AGC button a second time takes it to slow AGC, and pressing it a third time takes it to fast AGC. All you have to do is remember that the AGC button is on the bottom row, closest to the tuning knob.

Also visually-impaired,

Michael Bryant

Hi Michael,

I press the agc button until I hear the double beep. This way I know the agc is off.

Did you happen to see this?

From: <camenning@...>
To: <icomr75@yahoogroups.com>
Subject: [icomr75] Re: Reading the manual-very necessary
Date: Wednesday, December 25, 2002 4:04 PM

Just to add to the confusion....

The AGC comes back on in the mode it was when it was turned off.

Could be fast, could be slow (normal). Whatever you had it set to previously.

Craig

I received my r75 via UPS last Friday. I did a lot of playing around with it last night and I found another way to determine if fast or slow agc is on. I tune into a strong station on mw, turn the tuning knob and listen for the delay. The longer of the two is slow agc. On sideband I cannot hear any difference when switching from fast to slow agc. On my Satellit 800, I can hear
the difference when switching from fast to slow agc.

How long have you had your r75?
Do you know of speech friendly software that would allow me to access the filter setup menu, the set mode menu?

Russ

Not really. It's usually pretty obvious when the AGC is off, as volume
increases greatly and carrier howls become deafening.

Thanks for the tip, though.

Michael Bryant

Topic: 3369 Message: 3369

I was wondering if one of you antenna gurus out there can give me a bit of help.

I currently have an Eavesdropper-C installed under my roof eaves only about 8' above the ground (Deed Restriction limitation). It works well but I would, of course, like to improve the performance of my R75.

We're, supposedly, going to get a relaxation of the Deed Restrictions that would allow me to maybe raise it about 6' (for a total of maybe 15').

Question, is it worth the effort? Will the increase in signal strenght be noticable on the S-Meter?

Thanks.

John Pickrell

==========

If your eaves are metal,, I would say do it. If they are the plastic variety it probably wont make a noticeable improvement. Im kind of in your same situation, kind of a pain in the hiney isnt it?

Jeff

Will the increase in signal > strenght be noticable on the S-Meter? Believe it or not, but the maximum height above the ground of my best tropical band and medium wave antenna is about 1 meter. This antenna outperforms my T2FD by about 20 dB for .5 to 3.5 MHz. My T2FD (which is at 3 to 5 meters above the ground) seems to be able to receive well on pretty much all frequencies between 4 and 40 MHz. I have no idea whether it'd be doing better at higher heights, but I'm pretty sure that: 1) it wouldn't fix the performance problems on the low frequencies (where I simply use another antenna instead) 2) I don't need the extra performance between 4 and 40 MHz, where the T2FD is already performing great Rik -- Bravely reimplemented by the knights who say "NIH". http://www.surriel.com/ http://guru.conectiva.com/ Current spamtrap: october@...

> but I have little familiarity with switching diodes.

i have no formal electronics training [corrections welcome]...

diode D172 allows the direct current switching signal (B0) to switch RF and thus prevents running the RF line all over the PCB (as a mechanical switch would necessitate). regulatory positive DC enters the system via R174 [make sure this component is not an open and that DC voltage is present], moving to R173 in parallel with R171/R172, C175 blocks DC, allowing the switching voltage to enter the PIN diode anode (small signal AC is now permitted through the device [probably seen as a capacitor to AC]), C361 blocks DC and the switching signal is shunted to ground through R361 [check for open], L361 acts as an RFC (radio frequency choke) blocking incoming AC from being grounded [check for open]. R171/R172/R173 form a pi network RF attenuator, AC being shunted to ground for the network via C176 (DC switching signal is blocked).

regards,

phil :)

hi phil. i think a 1n914 or equivalent would work fine. radio shack
used to sell them 10 for a buck, they may still do. you could mount
it vertically,so you could space the leads to match the chip diode.
diodes have a polarity, anode and cathode, it has to match what you
ate jumpering. hope this helps. BOB...

Hello Guy,
You could replace this component with an HP-5082-3080 or HP-5082-3081 pin diode. The 1N914 is a silicon switching diode. It should be replaced with one of the HP mentioned above.

There is an excellent article called Tips for Improving Receiver Performance at:

http://www.kiwa.com/rxtips.html

Note the section on Input Filters where it specifically talks about switching and pin diodes.

Hi Phil, Bob and Al:

Thanks for all your helpful comments on the MW attenuator section of the R75. On Thursday afternoon I performed most of these checks on my R75, although the work was much more difficult because the stereo microscope I was used to having at work is currently out for repairs. I didn't check L361... I hope that component is not the one! :^) I checked, and then replaced D172 with a 1N914 diode but no improvement.

I ran out of time and interest on this problem, so yesterday I delivered the rig to the Service Dept. at ICOM-USA headquarters in Bellevue. That's one reason I like owning an ICOM-- it's great to have service & parts within driving distance. Althought their web site says "5-10 working days" for turn-around, I was told it's more like 12-14 days now.

Hi Guy,

Did you check if the control DC reaches the valve?

Well, I hope Icom will fix it for you. You are the first person I know of who gave his modded R75 for repair at Icom service center. Did you discuss with them about warranty and mods? Are they going to revert the MW bandpass filter to original state (un-mod it)? Maybe it all depends on the person who will service it.

Happy holidays!

Rado

Hi Rado,

I checked for the DC control voltage, and it swung about 9.3 volts when I tuned above and below the 1.6 MHz cut-off frequency. So, I presume the control voltage is OK.

It was with a bit of initial concern that I turned this modified radio over to ICOM. However, I decided that with all the receivers & transceivers they must get in for repairs, they probably see modded radios on an occasional basis. I know there are quite a few mods known in the ham community for well-aged rigs like the IC-735 and others.

I printed out a detailed description of the problem for the ICOM techs and gave it to the Service Dept. person. I also listed the mods I have installed and described what portions of the PCB & components they attach to. Most importantly, on the paper I mentioned that the other mods work correctly and asked them to *not* remove any mod(s) unless absolutely necessary to fix the MW attenuation problem. For ICOM's reference I also included a color printout of the MW attenuation mod file (PDF) which Phil compiled from Peter Gianakopoulos' information.

I hope this helps them to solve the difficulty with minimum fuss! I was told that turn-around time is currently 12-14 business days. When I had a R-70 in for repairs some years ago, they also said "12-14 business days" but they had it ready for me in 8 days. I'm hoping their current estimate is conservative!

From: Craig Seager
Topic: 3390 Message: 3393

This is really comparing apples and oranges; the FRG-100 is a well performed receiver, but is aimed at a slightly less discerning market. Both the Yaesu and R75 are very sensitive receivers, but sensitivity shouldn't be the major consideration. Most serious receivers have adequate sensitivity, but it is selectivity and strong signal handling performance that are more relevant specifications. The R75 is ahead in both regards, and offers more options in respect of filter selection.

Add to this features such as notch, twin passband tuning, keypad frequency entry (without additional add-ons), dual preamps, DSP noise reduction etc. and it becomes clear that the R75 is a natural upgrade move from an FRG-100. I did just that a couple of years ago, and have never looked back.

Regards

Craig.

I just recently sold my Yaesu FRG-100 receiver and I am wondering is the R75 a qood quality replacement is the sensetivity as good or better than the Yaesu receiver? any info would be appreciated. What are the pro and cons of this receiver?

Being blind, I especially like:
UT-102 Voice Synthesizer
announces frequency, mode, signal strength and time.
The FRG-100 doesn't have this option.

3395. Coax Type

Yahoo group: icomr75 (2000 — 2002)
Date: 2002-12-31 02:45:57 UTC
From: Moxie3
Topic: 3395 Message: 3395

I'm a little confused, actually much more, about which type coax to buy. The total length of wire required from the antenna to the radio will be either 100 feet or 50 feet depending upon which route I follow. I realize that the shorter length the better but I may have no choice but go with the 100 foot route. I've read somewhere that the RG-8/X is good up to 100 feet; over 100 feet is supposed to be a different type coax because of signal loss. Would anyone know the loss of signal with using 50 feet of wire vs. 100 feet of RG-8/X?

Secondly, the Passport Evaluation of Popular Outdoor Antennas White Paper recommends either RG-223/U or RG-213/U; it doesn't even mention RG-8/X. Furthermore, I don't even see RG-223/U in the Universal Radio catalog. Which in your opinion is the 'standard' cable that most of you use? Any help would be appreciated.
George

==========

Most loss charts start at 100mhz. so at freqs. at the sw spectrum
up to 30mhz or so, loss is a fairly insignificant figure. If you got
a "good" quality RG58 cable I doubt it would make any significant difference
between a good quality RG 58 and RG 8 on the recieving end. If there would be
any loss it would be in the fractions of a db. Even if there was a 1-2 db
diference(which I doubt there would be) thats not enough to make a noticeable
difference. Above 100mhz is a different story.

Jeff

Would anyone like to trade?

I have a Icom R-75 receiver. No mods. It does have the UT-106 (DSP). There is nothing wrong with the radio.

I'd like to trade for a Yeasu FT-817. Dont need any fancy filters or antennas with it. Just the plain jane radio. With a battery of course.

Lloyd Davies,
N0VFP

hi Moxie3:

> Would anyone know the loss of signal with using 50 feet

> of wire vs. 100 feet of RG-8/X?

coax is better than wire because of the shielding. RG-8, RG-58, and RG-174 are all 52 ohms [diameter gets smaller respectively]. i agree with Jeff... larger diameters technically may be lower loss but their main advantage is power capacity... this is important to ham operators. FWIW a PL-259 doesn't need an adapter to mount on RG-8.

I use RG-58 with no problems. I don't believe it matters too much for H.F. (unless you're transmitting). I think it would matter MORE for VHF/UHF, and only if you use lengths over 50ft...

If you live in an area with low interference level, perhaps you should try using the antenna wire all the way to the receiver, and then try the High impedance antenna input. At least on the AM band you get better match with the ANT2 input with short antennas, less than perhaps 200 feet.

If you have a lot of local interference I would recommend the RG58 and a balun feeding the wire antenna. The loss is just fractions of dB unless you have very long feedlines.

From: Bob
Topic: 3403 Message: 3403

Does anybody use the Sangean VersaCorder sold by C. Crane Co. with their radios? I am thinking about it for time shifting shortwave broadcasts and for recording milcoms while I am not at the scanner. My questions are:

1. How is the sound quality at its 1/4 speed setting?
2. Does the VOX mode work with the line input or only with the mic?
3. Is the 5 second gap it records in the VOX mode after a transmission a problem?
4. Any other comments?

I saw the review on this product in Monitoring Times, but I would like to hear from anybody who has actually used this recorder in their shack.

Thanks.

Bob

hi Patrick:

> Ever try ECSS with an ATS-909? 40Hz tuning.

i haven't touched my ATS-818 since i compared it to my "then new" R75.
SSB on the 818 has bad drift and the noise is horrible. the step from
portable to tabletop is a huge one... especially on SSB.

HAPPY NEW YEAR EVERYBODY!!!

Hi! The name is Cliff and I am new here...I looked over many of your
posts on this room and found a wide range of knowledge and expertise
here helping me to make the purchase decision. Was looking at the
Yaesu 5000 and found out it was junk...suprised me.
==========
Hi Cliff

Im sure you will be very pleased with the R 75 (have one). If your interests
are HF it will work very well for you. Im curious about your statement about
the VR 5000 being "junk" (have one of these too) and I love mine. It doesnt
have all the bells and whistles that the R 75 has but it is a very capable reciever.
I have read where the VR isnt good on HF and doesnt recieve ssb hardly at all.
This view doesnt reflect my experience in the least. Mine recieves ssb extremely
well, radio for radio the VR will recieve all but the very weakest of signals the R 75
will.
I'm serious about this. The VR does drop out if your into MW signals but from 160
meters on up it really does an excellent job. I know the early versions had problems
but I think they must be resolved by now. (I did have to put an FM trap filter on mine)
but when you have a transmitting tower almost in your back yard I suspected I was
going to have to do this. The FM images only showed up above 50-60 mhz and up
and were quite annoying ,but the trap took care of that. In any event Im sure you'll
like the R 75.

Jeff

Stay away from the VR-5000
Time owned: more than 12 months
Let's be candid here; Yaesu is not a new kid on the block. They have
produced some
very nice
equipment over the years; the FT-101 series,
several CAT tranceivers, the venerable FT-736
satellite box, and of course the FT-1000 and its
many iterations. What is most remarkable about
the VR-5000 saga is how Yaesu completely missed
the mark with this rcvr.
There are many problems with this radio; the operating manual is missing
crutial
information,
==========

SWEET radio!!
Time owned: more than 12 months
This radio is a real TREAT! When I first got the radio is July of 2001, I
found that
it was a bear to program! Once you learn the learning curve, it can be okay
to program
but there are alot of steps to take. Alphanumeric programming takes even
more of
an effort!
Once you have it programmed, however, it is a wonderful receiver! The
sensitivity
is excellent, it has a wide frequency range, a very useful DSP function, a
cool voice
synthesizer (a bit wierd sounding) and even a digital recorder that capture
20 seconds

of audio!
I originally had firmware version 1.3 but I sent that radio is for an
"update". Version
1.7 works even better. What I have now is a smoother-operating radio with
less PLL
"hiss"!
If you have the patience to laern the programming methods, I would
reccommend the
VR-5000 to anybody!
Also, the price is lower than ever!!

and on the 5th day....
Time owned: 0 to 3 months
When I attempted to switch from programmed memory scan mode (PMS!) to memory
channel
scan, the VR5000 display locked up...no audio output and none of the front
panel
controls (INCLUDING THE POWER SWITCH) were functioning. I had to remove the
dc power
plug and wait a few minutes before it would power up normally, but it locked
up again
after turning the VFO dial. With the assistance of a very helpful dealer
rep, I was
able to reset the ROM (depress clear button on power up) but of course all
memories
were lost....
My options...reprogram all the memories and hope that whatever keystroke
sequence
or software glitch that caused the malfunction never occurs again; return
the receiver
for warranty repair and wait weeks HOPING that it is actually repaired; or
return
it to the dealer and apply whatever credit they can give me to an Icom 8500.
It will be a tight fit, but I believe the 8500 will look good on the shelf.
==========
His loss of control was one of the problems the radio had and usually had to do with
low voltage. 0-3 months of use is not enough time to get to know this radio

Update
Time owned: 0 to 3 months
After writing my previous review on 2/8/02 I have continued testing in the
460 mhz

region. I don't know what changed . . . but the receiver now seems to be receiving
fine in that general range.
I can't explain why it is now receiving properly . . . the antennas are all the same
etc. My only explanation is that my previous test methods were faulty in some way.
However, to balance the good/bad again a new annoying thing has popped-up: the receiver
"image rejection" seems marginal. We have several local FM radio (broadcast) stations
and they can be clearly heard in several places.
E.g. 98.1 can be heard strongly at 111.75.
104.5 can be heard clearly at 118.150.
The difference in each case is 13.65 mhz, which if not a direct 'image' is some conbination
of frequency monkey-motion.
At any rate, I still like the little receiver!

short commings of the VR-5000
Time owned: 0 to 3 months
I find this receiver to have some very basic faults that render it unaccepable. Within
6 days of owning it it went brain dead. Took over 6 hours with power supply unplugged
to come out of it's coma. Since then this happened 2 other times that resulted in
a complete loss of all programmed memories (about 60 ch). Which brings me to the
biggest short comming of this receiver. The CAT interface will not address the receivers
memory which means you can not store or modify the programming of memory on a PC.
I was amazed that a micro-controlled radio of this price range did have a complete
computer interface and command set. Major feature fault!
As for the manual, it is incomplete at best. It's missing a number of feature discriptions
and some menus discribed in the manual does not match the receiver's. It's hard to
follow, poorly organized and written. On top of all that when I tried to contact
Yaesu it took over two weeks for them to responded to my first email. Once they did
they could not explain to me how some of the functions were actived or used. The
tech support person (Chip) could not answer a number of operational

questions and
had to research the answers. After about 4 or 5 email exchanges over the
past 3 months
I still don't have all my questions answered. I find this to be unbelievable
and
unacceptable support from Yaesu.
I'm now asking the dealer to take it back since the problem with brain
death, memory
loss and lack of a means to store/restore memory programming render the
programming
part of the receiver unusable. I didn't pay over $900 for an incomplete or
defective
receiver.
My suggestion to others looking at the VR-5000 is to look for something
else. This
receiver needs a lot of work to make it ready for release to the public. I
believe
the firmware has major bugs that need to be fixed. Oh, by the way it is not
field
upgradable so even if they fix the code you'll have to send it back for the
upgrade.
Another amazing short fall in this day and age of flash memory and
field/user installed
upgrades.
YAESU...you blew this one big time!!!!
==========
Another loss from low voltage ,,,, it will lock it up. Lack of computer control is
a major issue with alot of people .

Absolute CRAP!!!
Time owned: 0 to 3 months
What's worse is Yaesu's flat out refusal to so much as acknowledge
many of the '5000's defects! (The smart search 'bug' for example, BTW
the 'work-around' [using the clear key] was effective on but a moiety
of the radio's tested) -- Out of curiosity, I have purchased 10
(that's right TEN!) VR-5000s and found each to have its own,
unique 'syndrome' EVEN WITHIN THE SAME FIRMWARE VERSIONS!
(Principally 1u.13)- missing band segments being among the most
egregious!
==========
Who in there right mind would buy 10 radios they claim to hate???
Missing band segments. European maybe but not US versions, except cell.

Things Get Better
Time owned: 0 to 3 months
Since adding my first review a while ago, I can justifiably say that this receiver
just gets better each time I use it, most likely because I have basically gotten
over the "break-in" period for this complex radio, oh! and since the manual hasn't
been all that much help (apart from the most basic functions), I have begun to push
buttons and choose menu options of my own accord and they are yielding some great
results...
This radio is really beginning to grow on me and continues to impress me with its
performance. Since I last posted the "first" VR-5000 review, I have lifted my Diamond
Discone antenna a few more feet in the air, so it is now a bit higher that the apex
of the roof and that has really made a difference, not to the closer stations but
to the more distant ones. I regularly enjoy listening to full strength, or at least
higher strength than before, stations and its a real pleasure.
I have seen a few of the criticisms of this radio, from others,, and I have had a
few myself but to those who speak the loudest, I can only say "own one for a little
while and I am sure you will like it". I know this is not a practical way to answer
those non-believers as they most likely already have spent their mountains of gold
on their choice but I bet they too, will find something to get upset about in their
new investment(s) - whether they are honest enough to admit it is another thing though..
I, personally, still class this radio as a "receiver/scanner" as opposed to a "scanner"
when all things are weighed up, considered and then compared to others. It does have
many or even just about all the attributes of many other scanners but it may not
be as fast or have all the bells and whistles that other brands have,, so for that
reason, it may be considered to be a tiny little bit behind the eightball in terms
of the latest available in "absolute scanning" - You,, can choose the absolute king

of scanners for yourselves... The VR-5000 does, however, have a highly
configurable
menu system (even if it is a little hard to get used to) and lots of hidden
features
which are now emerging via the little VR-5000 networks that are popping up
like mushrooms.
Many of the buttons and combinations of, are also being discussed via the
"grapevine"
too.
I feel confident in saying that this receiver will become either a major
talking
point or a very popular radio or maybe even, both. From what I hear, the
user manual
is being reprinted right now but that is only from one source who was
supposed to
have contacted Yaesu. If this is true then I am sure things are looking up.
To my
knowledge, this "manual issue" may well have been Yaesu's first big mistake
(in terms
of non compliance or falling short of the mark) and I am sure they will not
let it
happen again...
Stay tuned.......
Page 1 of 2
==========

I have never said the radio was perfect,, re-read what I did write. "It works very well for me, especially on the HF bands" It does have some drawbacks, crappy manual no computer control etc. Mine has never once "died" on me. It just works and works very well. I'll say it again "there is no comparison between the VR and the IC 8500, except they are both radios, they are not in the same class,, what is the going price for the 8500??

Having just received my ICOM R-75 a few days ago from Ham Radio Outlet ($450), the actual circuit board module was included in the shipment. It would be a good idea to ask your sales person to be sure and not forget to put it in the box, because the circuit board add-on is packaged in a separate box.

Mine was shipped with the radio.

Hello Group.

I second Guy's comment that having the complete MW attenuation removal on the R-75 should give it much better MW-LW sensitivity that just shorting the pads. Recently I sent my new R-75 to Craig at KIWA to have the MW-LW attenuation completely removed. The modification cost me $25 instead of the $50 he charges for shorting the pads. It is the same modification available in detail on the R-75 page.

With the complete removal of the MW-LW attenuation, my R-75 now comes to with just a tiny hair of my PALSTAR R-30C without using the R-75's pre-amps on MW and LW. With pre-amp #1 it is certainly equal. With pre-amp #2, it is superior to the R-75 in situations where intermodulation is not a problem. (Intermodulation is a problem with pre-amp #2 where I live because of two near-by 5KW MW transmitters, one of which is less than 8 blocks from my home and is directional at night in my direction.)

Furthermore, as good as the PALSTAR R-30C is at resistance to front-end over-load, the R-75 with complete MW-LW attenuation is slightly better than the R-30C in this area when the pre-amps are not used. This, in my opinion, is amazing.

I am just starting to DX in the long-wave spectrum and anxious to log some trans-Atlantic LW dx.

Hi Al,

If you can get the full MW/LW attenuator modification done to your R75, it will provide a good amount of additional sensitivity compared to just shorting the pads. I'm very glad I did this mod, as it really helped make the R75 perform closer to my AR7030 for foreign mediumwave DX. It requires good experience soldering and a delicate touch if you do it yourself (plans are in the files section of the R75 Yahoogroup), but Craig at Kiwa offers this mod, too.

For the NDBs, my modded R75 and modded AR7030 perform very close to one another. There are occasions where the AOR picks up something that the ICOM cannot, and vice-versa.

Hello Rick,
I agree with you on the performance of the R75 for longwave
listening. I too am an NDB hunter and I find the R75 to be the best
of my bunch. I also own an Icom 745 transceiver and a Ten-Tec RX-350
receiver.

For program listening, the Ten-Tec is the best of the bunch. The
audio quality is great. When I want to listen to content, I bring out
the Ten-Tec. When I want to DX, it's the R75.

I modified my R75 by replacing the 15kHz FL-23 filter with a 6kHz FL-
116 (audio quality in not an issue for DXing). I also shorted the
pads of the lf attenuator to increase the low frequency gain
slightly. I can't say for sure that these changes made an improvement
to my NDB hunting, but in principle, reducing the filter width should
have somewhat reduced the overall noise and noise floor of the
receiver.

If I had to choose between my radios, I would still keep all of them.
I can transmit on my 745, DX on the R75, and enjoy programs
(especially with my DRM mod) on my Ten-Tec.

6349. MW DX ADVICE REQUESTED

Yahoo group: icomr75 (2000 — 2002)
Date: 1990-12-29 00:08:42 UTC [implausible archived timestamp]
From: Kerry B. Wynne
Topic: 6349 Message: 6349

Hello Group. I'm hoping for some expert technical help in the area of MW dx'ing.

Today I had my MW dx'ing confidence blown to shreds. Wanting a frame of reference for my three good communications receivers, including my fully modified R-75, I compared them with what the radios in our two cars could do on some of the weaker stations around noon today. To my great distress, my car radios were able to pull in these weak test signals as well as, or almost as well as, my three communications receivers hooked up to a 175' random wire antenna! And the car radios were doing it with a 31" whip and base loading coil (as is the case with all car radios).

Perhaps it is because my 175' random wire antenna doesn't go in a straight line. It goes down one side of the yard, across the back fence, from there up to the chimney, and from there straight out to a tree at the street.

Particularly upsetting to me was that the car radios were able to pull in 1020KC KDKA from Pittsburg, PA from here in South Western Ohio about as well as the communications receivers hooked up to my 175' random wire. This signal is the weakest reliable day-time DX signal available to me at this time of year.

Perhaps my random wire is too long. The best DX results I have ever had were with a 100' random wire antenna and a multi-tap loading coil in conjunction with older sets like the DRAKE SPR-4, Zenith TransOceanic Royal 7000Y, and REALISTIC DX-160. These older sets don't have any L-C circuitry in their front-ends, so supplying some inductance between the antenna and the sets worked great, provided the antenna is shorter than the desired wave length. The newer receivers seem to incorporate the right values of inductance in their front ends to give acceptable performance at each frequency with antennas that range between 30 and 100 feet. I judge this to be the case because adding inductance to my random wire turns my old DX-160 into a BCB power house, but added inductance from a multi-tap loading coil clearly decreases the performance of my PALSTAR R-30C and my modified R-75.

These are the kind of questions that go through my mind: (1) Am I expecting too much from 175 feet of wire? (2) Would a KIWA Loop or Quantum Loop antenna hooked up to a fine communications receiver work better than a car radio? (3) Should I shorten my random wire to 75-100 feet and try a variable tap loading coil again?

Thanks for your help.

KBW

6356. HELP WITH MW DX RESPONSES

Yahoo group: icomr75 (2000 — 2002)
Date: 1990-12-29 23:29:27 UTC [implausible archived timestamp]
From: Kerry B. Wynne
Topic: 6356 Message: 6356

Thanks to Phil and Atagrasin for responding to my request for helping to boost my MW reception.

Phil, I will take your advice and either make a home-made loop antenna or buy a Quantum Loop. As you say, this should be superior to the 175' of random wire I am now using, and it should be superior to my car radio.

Atagrasin, I will take your advice to try to straighten out my random wire antenna. I just might have enough space in my back yard for a K9AY. What are the dimensions in feet or metres square that would have to have to put one up? If it is comparable to some beverage antennas, it is just what I want. Also, I do have Pete's attenuator removal mod on my R-75. Craig at KIWA Electronics did it for me. This modification costs $25 USD instead of the $5 USD for the one that merely shorts the pads.

Thanks, again, to both of you. I have printed out your responses for my file.

To others in the group, I still invite your comments and assistance as well. Again, I am pleading that the radios in my two cars perform about as well on MW as my R-75 (and other receivers) hooked up to my 175' of random wire antenna.

Thanks!

KBW

Gary:

It's great to hear from a Quantum Loop QX-PRO owner. The directional capability is appealing, since many of the stations I want to DX have other signals on the same frequency.

Can you compare it's raw signal pulling power to a good car radio. Let's say there is a 50,000 day-time power house 500 miles away with no other stations on the frequency and the signal is so weak that it is difficult to understand any of the programming. Which will do better? The Loop with a good communications receiver attached to it, or the good car radio with the antenna fully extended?

Thanks!

Hi Kerry,

I have a Quantum QX Pro Loop, which has a 15" ferrite loop head. In contrast to a car whip antenna, which is omnidirectional, the QX Pro is quite directional, which allows improving the desired signal while rejecting undesired signals in different directions. The QX Pro is also great for reducing local noise; this is accomplished by properly rotating and tilting the loop head. I'm very happy with my QX Pro.

Regards,
Gary

Here are some links worth pursuing:

Phil mentioned the K9AY page:

http://www.hard-core-dx.com/nordicdx/antenna/loop/k9ay/index.html
Also worth mentioning is that this antenna can be scaled down for
SWL only use. I'd try it if I didn't live in a condo.

The Wellbrook (IMO stellar) design K9AY is depicted here:
http://www.wellbrook.uk.com/K9AY.html
Also have a look at their well regarded loop antennas.

The Yahoo Loop Antenna group is here:
http://groups.yahoo.com/group/loopantennas

A loop antenna page with links:
http://www.frontiernet.net/~jadale/Loop.htm

These should get you started.

Hi Kerry,

I can't really answer your question regarding the raw signal pulling power of the R75 with the Quantum QX Pro versus a car radio with a standard whip.

What I can tell you is that it's much more pleasant to listen to my R75 than the car radio. The R75 has more and better IF filters, and S-AM mode (Kiwa modified) cuts down on selective fading distortion. The IF filter on my car radio is very wide, and let's in all kinds of adjacent channel garbage.

Regards,
Gary

Subject: [icomr75] Re: HELP WITH MW DX RESPONSES

hi Kerry:

the R75 has better specs than a car radio. my $10 AM radio with an RS
loop will beat a car radio hooked to its whip. the antenna is
critical on MW. R75 versus car, hooked to the same antenna... a few
percent of stations will be too weak for most car radios to hear.
also stations adjacent to strong local ones will probably be buried.
this is for IDing, for listening to tough stations there is no
contest... the R75 has many features to clean up a signal.

Neil:

I also have an R-75 and a SANGEAN ATS-909. I use them with a 175' random wire antenna fed from a balun I got from the Shortwave Store in Canada through an MFJ-956 pre-selector. On the R-75 I hook up to the 50 ohm connector. With the ATS-909 / DX-398, I use short jumper cables to connect the coax to a stereo 1/8" mini-plug plugged into the external antenna jack.

It is with the Sangean radio that the powerful help from the balun is apparent. If I use an earth ground with the Sangean, I get all kinds of intermodulation products across LW-MW and the lower SW bands, but if I connect the outside ring of the coax to the grounding terminal on the 1/8" stereo plug, a huge amount of the intermod products go away!

I have an 8' metal rod driven into wet ground as my Earth ground. The Earth ground helps the R-75 just a little bit on MW and LW, but not on the SW bands.

The Shortwave Store in Canada makes the baluns in their own facility and sells them for about $30. A similar product costs about $50 from Universal Radio in Ohio.

Subject: [icomr75] Question on ground connection

Where my new R-75 will go, there is no possibility of a real earth grounding rod. I could connect to the house electrical "ground" but wonder about induced noise. I have a 75' longwire antenna which on my Sangean, I simply clipped on to the whip.

I assume that when my R-75 arrives, I will connect that to the 500 ohm antenna connector. Is the ground really essential?? Any suggestions geatly appreciated for this newbie to a "real" radio!

Should I put a coax feed on the longwire and use the other antenna connector? Balun ??

6393. Q-LOOP VS PALSTAR MW550P

Yahoo group: icomr75 (2000 — 2002)
Date: 1991-01-01 14:08:23 UTC [implausible archived timestamp]
From: Kerry B. Wynne
Topic: 6393 Message: 6393

Phil:

The main reason why I have been interested in the PALSTAR MW-550P is because of it's tremendously sharp rejection of adjacent channels due to it's extremely high Q. However, about a year ago I e-mailed Gerry Thomas at DX TOOLS about the QX-PRO. If I remember correctly, he said that the Q multiplier also helps to clean up front-end over-load in the presence of strong signals, by achieving a very high Q. He also said, if I can remember correctly, that the QX-PRO is equivalent to a 175 ft to 200 ft random wire 25 to 30 feet in the air.

Do you live near any MW stations, and, if so, can you tell me how effectively it reduces intermodulation on the MW band? If possible, I would like to know about this performance feature when used by itself and when used with a random wire external antenna hooked up to the external antenna connection.

Thanks!

Jake:

I am interested to know how your MFJ 1026 nosie canceller works because I have powerline noise issues in my neighborhood. Of course, I think we are all interested in how the R-75 compares with the R-70 and NRD-525. My key point of interest would be how the receivers compare in their ability to handle strong AM (BCB) signals from near-by powerhouses without generating spurious responses in or out of band.

Thanks!

Kerry

David:

Thanks, also, for your input re: the MFJ 1026. I don't think I would might hainvg to readjust each time frequencies are changed. That makes dial twisting even more fun.

Thanks, again.

Bill:

I am anxious to see how the AOR LA-380 works with your R-75. I am thinking about getting a loop of some kind, and have been looking at the AOR, Palomar, and Quantum loops. I specialize in day-time dx. Please let us all know how the combination of the R-75 and LA-380 work.

11487. DC POWER CORD FOR R-75

Yahoo group: icomr75 (2000 — 2002)
Date: 2001-03-27 15:22:26 UTC
From: KERRY B. WYNNE
Topic: 11487 Message: 11487

Hello Group:

I need a power cord that plugs into a cigarette lighter 12V and plugs into DC power recepticle of the R-75. Some time ago I noticed some posts in regard to this, but I didn't pay mjuch attention to them since I thought I had such a cord. Turns out a "standard" cord won't work with the R-75 because the 12V recepticle's center post is larger in diameter than the usual 12V DC recepticle.

Can any one give me a Radio Shack parts number for the cord or tell me where I could get such a thing without having to buy the ICOM product for a very large sum of money?

Thanks for your help!

Tracey:

I here-by retract my "unparalled" statement. AOR UK takes the cake! That is really impressive!

I would appreciate a comparison between the AOR 7030 and the R-75, particularly in regard to front-end over-load from strong MW stations.

Until just recently I lived 7 blocks from a 5KW MW station that was directional in my direction after sunset. With my 175' long-wire antenna, I had trouble with spurious signals, partkicularly between 1.6 and 5MC, with both my R-75 and my R-30C.

Awaiting any possible post from you.

Thanks!

Kerry

Subject: [icomr75] Palstar Service

Hi Kerry

I'm sorry but I'll have to challenge your claim that the quality of service and standing behind the R-30 is
unparalleled in the industry.

I've got a couple of AOR 7030 receivers and Palstar would have to go some to beat the quality of service
that I get from AOR (UK)

Foe example, last week I took one of my receivers that I recently picked up on ebay in for some modifications.
It was dropped in with them at 11.00am and was ready for collection by the end of the afternoon.

The work included fitting a replacement display, changing the tuning encoder for a lower pulse rate one (my personal preference here, not actually needed), fitting a 250Hz CW filter, changing the back-up battery, replacing a lost rubber foot and wiring out the AGC line to a rear socket
They did all this work I was charged for one hours labour.

I also own a couple of R75s as well but no R30

Regards

Tracey

Jim:

Have you tried a pre-selector yet? I have both an MFJ-956 and a Palstar MW550P. Both work very well at taming a powerful MW signal. Although I am in the middle of moving from one house to another, the MW-550P seems to work better than the MFJ-956 on MW itself. However, the MFJ-956 permits preselecting on SW and tames spurious signals between 1.6 and 5mc very well.

My R-75, just like everything else I own, chokes and pukes on the 50Kw AM blowtorch about 1/4 mile away (during the day)...

Topic: 11609 Message: 11647

Bob:

Thanks for taking the time to summarize the Sherwood Labs test specifications between the R-75 and R-30 receivers. They are very similar!

The theory I have heard, as to why the R-30 is quieter on MW, suggests that the R-30 has less synthesizer noise. However, it seems to me that Bob's test results would be affected by synthesizer noise.

All I know is that in direct comparisons between my R-75 and R-30 receivers, I can ID extremely weak stations significantly better with the R-30.

Any ideas, anyone, as to why this is true?

Thanks!

Kerry

Scott:

Sounds like you have serious trouble with QRM where you are. I have read extensively about the Timewave and MFJ noise phasers, and I wonder if one of these products would help you. From what I have read, if the noise is coming from one source, the results can be dramatic. The MFJ product requires modification for MW use.

Jim:

From what I have read, either one would probably be a good choice for SW. Neither would help with MW dx'ing, I don't believe. If you get one of these units, please share your experiences with the group.

Thanks!

Steve:

Good thoughts on the R-30 audio intelligibility. It could be simply an audio issue, or it could be lower synthesizer noise, or the design of the AM demodulation circuit. Perhaps when I get my antenna set up at our new home with underground utilities and lower QRM, I will be able to research the differences more.

Bob:

I have two tuners, an MFJ-956 and Palstar MW-550P. You can read my comparison and contrast of these two tuners by going to EHAM.net and looking up my review on the MW-550P.

Think of the tuners are filters. If you live in a strong signal area, especially with powerful MW transmitters near-by, you may not hardly be able to use your radio without an antenna pre-selector. There is a difference, I believe, between a pre-selector and an antenna tuner. I explain my theory about the difference between the two in my reivew of the MW-550P, but I am not technically educated enough in radio to know if my theory is correct, and I stand to be corrected by more knowledgeable radio enthusiasts.

You will not find a signal increase except under a few conditions, but you will find far fewer images. If you have a radio with a poor front-end, like the Grundig S-350, the MFJ-956 would eliminate almost all the unwanted images, even though it is a single conversion receiver.

Hope this helps.

KBW

It has been my understanding that tuners are effective (and necessary with wire antennas) for transmitting, but do little to nothing for receiving. Can anyone else weigh in on this?

To Steve,

And anyone else using a simple longwire. You might want to look into getting a small antenna tuner to better match your logwire antenna to your radio. Nothing big, just a small one. MFJ has a few that would do nicely for not much money.
This might help your reception. Just a thought.

I would be interested in hearing more about your series/parallel BCB tuner and how it increases your signal strengh. My experience with antenna tuners and the R-75 has seldom been an increase in signal strength. On the other hand, I got a tremendous increase in fewer images from the powerful local BCB stations, one of which was only 7 blocks away.

Although my knowledge of electronics is very limited, I think you may find that your antenna tuner does not work with the R-75 like it does with your Hammarlund Super Pro 210X. It appears to me like the R-75 uses an L-C filter in the front end and that the inductance added for each range is what the designers considered to be typically what would be needed to provide reception with a 100 - 150 foot antenna. What this has meant to me, in practical terms, is that unlike with my DX-160, which does not use an L-C filter in the front end, I can not increase my BCB signal strength with a shorter antenna by using a loading coil tapped every 10 turns with the R-75, or, for that matter with my Palstar R30C.

If you are really using a BCB antenna tuner with variable inductance, you may get very different results with the R-75 than you did with the older receiver.

I would be interested in any comments from members who have more technical knowledge than I do about the difference between an antenna tuner and an antenna pre-selector, if, indeed, there is any difference.

Thanks!

KBW

Subject: Re: [icomr75] Re: Now hear this..

Greetings;
I'm new to this group and this radio, having just ordered a nice 2nd hand R-75 from HRO & yet to arrive. I did a lot of research & decided against the Drakes as I loathe the famously unreliable crummy Klixon type dimple button switches and the lousy tuner pulse coders they reputedly used. That pretty much left this set as the only other sensible option, there are zero reliability complaints of record AFAIK on the IC R-75 unlike many of the competition. FWIW, I've had zero issues with the buttons & coder wheel on my 18 yr old Sony ICF 2010. What's Drake's & AOR's excuse?

On to antenna tuners for reception;
I am using a specialized series/parallel BCB tuner in series with the balanced antenna input to a properly maintained Army Signal Corps Hammarlund Super Pro 210X (archtypical "industrial strength" late 1930s all-wave SuperSet) for BCB pleasure DX and the effect is nothing short of phenomenal as far as S/N improvement & sig strength goes. I have yet to try it on a modern set but will when the '75 is here.
This tuner design is commonly used as the "front end" of DX contest-class totally passive

BCB crystal sets and works equally well either series coupled or inductively coupled to the next stage & typically produces a very sharp 'Q' peak. It could theoretically easily overdrive an unattenuated solid-state front end I suppose but the improvement in S/N would be well worth the extra bother IMO. I want to put an all-band version of this tuner together to try with short wave coverage off the 100' longwire when I get the parts together.

Steve Dresser <s.dresser@...> wrote:
Bob,

You're absolutely right. Detuning them will cause the signal to be attenuated, but other than that, they have very little effect. On the other hand, introducing a pre-selector into the antenna path can keep the front end of the receiver from being overloaded by unwanted signals, but I don't think this is an issue with the R75.

Bucky:

If you are interested in MW or LW dx'ing, your only choice is the MFJ-956. You can read a review comparing it with the Palstart MW-550P at E-HAM.NET.

These units, including the MFJ-16010, perform the function of "filters" to screen out spurious signals and usually do not increase signal strength. If you live in an area where your local MW stations are wreaking havoc with your radios, you will find that your money has been well-spent. On the other hand, if you live a long way from powerful AM stations, you may not notice much difference with any of your radios.

An antenna pre-selector is capable of helping a portable SW receiver compete better with the front-end of a table-top.

Subject: [icomr75] MFJ-956 or MFJ-16010

Hi Gang,

My wife has given me the green light to pull the trigger on an Eton E1 from Universal Radio for my upcomping birthday.

While I'm at it, I thought I'd get an antenna tuner/pre-selector, too.

However, I'm not sure whether to get the MFJ-16010 recommended by Harry Helms in his Shortwave Listenting Handbook, or the MFJ-956 I've seen mentioned quite a bit in radio forums.

Both units are passive; the MFJ-16010 can also be used for transmitting (if I ever get off a dime and get my ham ticket). The MFJ-956 is for receive only.

Whichever I get will be used on a 100-ft (30.48m) longwire strung from my R75 out the window to a garden shed. And it would also be used on the E1 and a Sony 2010, if ever I can find the one I'm looking for.

As always, your experiences, thoughts, and recommendations are appreciated.

Thanks!
Bucky
